Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES)

Assessment Report on Biodiversity & Ecosystem Services in Asia and the Pacific: A Primer

The world’s biodiversity is being lost and nature’s contributions to people are being degraded, which undermines human wellbeing.

The success of humanity’s efforts to reverse the current unsustainable use of our irreplaceable natural assets and heritage requires the best-available evidence, comprehensive relevant policy options and committed, well-informed decision makers. The IPBES assessment reports serve these ends, by providing the credible peer-reviewed information needed for informed decision-making.

The Asia-Pacific region hosts some of the world’s most critical bio-geographical, bio-cultural and socio-economic diversity. These diversities face unprecedented threats, ranging from extreme weather events to sea-level rise, leading to severe loss of biodiversity, increasing vulnerability and rising levels of inequality.

Growing human-induced challenges and opportunities for people across the region are the focus of a major new scientific assessment report, one of five being prepared by inclusive teams of leading international experts working with the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES).

These evaluations of biodiversity and nature’s contributions to people cover four world regions — the Americas, Asia and the Pacific, Africa, and Europe and Central Asia. They are scheduled to be launched in Medellín, Colombia at the 6th annual session of the IPBES Plenary (#IPBES6), in March 2018.

A fifth IPBES assessment report, also due to be approved and launched at the same intergovernmental meeting, examines land degradation and restoration, both regionally and globally.
The findings of these reports will also be key inputs to a new comprehensive IPBES global assessment report on biodiversity and ecosystem services, due for release in 2019, the first such evaluation since the authoritative 2005 Millennium Ecosystem Assessment.

In addition, the assessment reports will evaluate lessons learned and progress (or the lack thereof) on the Strategic Plan for Biodiversity 2011–2020 and its Aichi Biodiversity Targets, the Paris Agreement on climate change, and the implications for the United Nations Sustainable Development Goals (SDGs), as well as other global environmental agreements. The reports will also provide vital information for setting biodiversity targets for the period after 2020.

Often described as the IPCC for biodiversity, IPBES is the global science-policy platform tasked with providing the best-available evidence to inform better decisions affecting nature - by Governments, businesses and even individual households.

Three years in development, at a total cost of about US$5 million, the four IPBES regional assessment reports have involved over 550 experts from more than 100 countries, who have reviewed several thousand scientific papers, Government and other information sources, including indigenous and local knowledge. The aim is to arrive at conclusions about each region’s land-based, freshwater and coastal biodiversity, as well as the state of ecosystem functioning and nature’s contributions to people.

The assessment reports will evaluate the status of biodiversity and nature’s contributions to good quality of life in each region and their respective subregions, describing current status and trends, as well as their links to drivers of change and threats, identifying policy-relevant issues affecting them. The analyses will start by looking back several decades and then project likely interactions between people and nature for decades into the future.

Each regional assessment report will address:

- How biodiversity, ecosystem functions and nature’s contributions to people affect economies, livelihoods, food security and good quality of life. In other words: why is biodiversity important?
- The status, trends and potential future dynamics of biodiversity, ecosystem functions and nature’s contributions to people, which affect their contributions to economies, livelihoods and human well-being. In other words: are we making progress or are we still destroying biodiversity and undermining human wellbeing?
- The pressures driving changes in biodiversity and nature’s contributions to people. In other words: what are the threats to biodiversity?
- The actual and potential impacts of policies and actions on the contributions of nature to sustainable economies, livelihoods, food security and good quality of life. In other words: what policies and governance structures can lead to a more sustainable future?
- Priority gaps in knowledge.

‘Hot Topics’ in the IPBES Assessment Report for Asia and the Pacific include:

- Climate change impacts (particularly due to flash floods, sea-level rise, increasing extreme weather, ocean acidification and glacier melting)
- Sustainable consumption of biodiversity and ecosystem services
- Sustainable land management
- Managing deforestation
- Addressing invasive alien species
- Regulating adverse impacts of trade (including illegal trade in wildlife)
- Saving biodiversity from rapid urbanization
- Addressing coastal pollution
- Options for good governance of nature
- Reducing the impact of human-induced wildfires
In addition, the assessment report looks at issues specific to Asia-Pacific subregions, such as the nexus between food, water and energy security; biodiversity and livelihoods; as well as cooperative management and governance of critical cross-border ecosystems.

The Asia-Pacific regional assessment report covers five subregions: South-East, North-East, South and Western Asia, and Oceania. The territory covered ranges from the alpine biodiversity and pastoral systems of the world’s highest Himalayan mountains and the Tibetan plateau, to the small bio-culturally rich and distinct Pacific islands and ocean trenches – highlighting the state of ecosystem health of Asia and the Pacific’s vast, socio-culturally and socio-ecologically diverse subregions, which are facing unprecedented biodiversity loss and significant socioeconomic and cultural impacts.

The assessment report will take into account Asia-Pacific’s disparate national wealth and population growth rates, in the context of unprecedented economic growth and poverty reduction, but noting the continuing inequalities within and between nations. Since the region has more countries and territories than any other, and the highest concentration of rural and indigenous communities, the report will pay particular attention to rich bio-cultural diversity, the high interdependency of national economies on biodiversity, intraregional trade impacts, global and regional financial flows, as well as cross-regional policies, institutions and governance models.

Structure of the five IPBES assessments

Each IPBES assessment report will begin with a concise summary for policymakers (SPM), highlighting the most important and policy-relevant (not prescriptive) findings and policy and governance options. The SPMs will be based on a set of six chapters (eight for the land degradation assessment), described below, providing all the technical support for the key messages of the SPMs:

1. Policy-relevant questions & themes per region and subregion as well as methods and approaches of the assessment
2. Nature’s contributions to people and good quality of life
3. Status, trends and near future dynamics of biodiversity and ecosystems
4. Direct and indirect drivers of change in nature in the context of different perspectives on quality of life
5. Analysis of possible interactions between the natural world and society in the long term
6. Options for governance, institutions and decision-making – especially on the SDGs, Aichi Targets and Paris Agreement

To ensure the highest-possible levels of credibility and policy-relevance, the IPBES assessment reports have been reviewed extensively by hundreds of external experts, including Governments, scientists and decision makers, practitioners and the holders of indigenous and local knowledge.

The assessment reports will be presented with the widest spectrum of decision makers in mind, including Government and business leaders, civil society groups, indigenous peoples, women’s groups and even individual households, with detailed information, including easy-to-understand infographics and maps.
TIMELINE

January 2015
Scoping report established the parameters of the assessments.

May - June 2016
External experts and Governments reviewed first draft of the assessment chapters, with review comments incorporated into the subsequent drafts by IPBES experts.

May - June 2017
Governments and external experts reviewed the second drafts of the assessment chapters and the first drafts of the summaries for policymakers. These comments are being reviewed and will be incorporated into the final drafts by IPBES experts.

March 2018
Negotiation by member States at IPBES-6 Plenary session of final text of the summaries for policymakers of the five assessment reports in Medellín, Colombia, followed by their public launches.

Launch venue: IPBES-6, Intercontinental Hotel, Medellín, Colombia; March 17-24, 2018.

About IPBES

With 127 member Governments, the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) is the global body that assesses the state of biodiversity and nature’s contributions to people, in response to requests from decision makers.

Chaired by Sir Robert Watson, the mission of IPBES is to strengthen policy and decisions through science, for the conservation and sustainable use of biodiversity, long-term human wellbeing and sustainable development.

The IPBES secretariat, led by Executive Secretary Anne Larigauderie, is hosted by the German Government and located on the UN campus in Bonn. More than 1000 scientists worldwide contribute to the work of IPBES on a voluntary basis. They are nominated by their Governments or organisations, and selected by the IPBES Multidisciplinary Expert Panel.
