Metro systems in India: Case study DMRC

G. Tiwari, IIT, Delhi

Promoting Low Carbon Transport in India
National Workshop 19-20 October, 2011, Delhi
Metro systems in India

- Kolkata metro 18 km in 18 years, operational in 1986
- Delhi metro, first project report in 1969, operational in 2002
- 12th plan proposal: All 2 million plus cities should plan for corridors having 15,000phpd for 5 km continuous corridor, average trip length of motorised trips > 7 kms.
## Operational Metro Projects

Debt and Equity for PPP
DELHI METRO
Delhi- An Introduction

- Mixed land use pattern
- Central Core areas are both commercial as well as densely residential
- People of the lower classes reside at the outskirts in resettlement colonies built by the government,
- Elite class are mostly concentrated in the peripheral zones,
- and middle-class areas are dispersed all over the city.
Declining Share of Public Transport, especially Bus Transport

Modal Split - % of Person Trips (excluding walk trips) in Delhi*
(Figures in Percent)

Source: Delhi Traffic and Forecast Study (2008) commissioned by DIMTS to RITES
Delhi Metro Network

Started in December 2002
6 Lines, 190 Kms

Source: CDM report on Delhi Metro, UNFCC website

Actual Ridership < one-fourth of the Projected Ridership

Does this mean Delhi Metro achieves only “one-fourth” of the benefits mentioned in DPR? - Emissions, Travel Time, Accident
Financing - Delhi Metro; ~ 30000cr/186 km

- Central and State Govt. Equity
- Japan International Cooperation Agency (JICA) – 1.2% interest rate, repayment period of 30 years
- Property Development
- Interest Free Subordinate Loan by Centre and State Govt. for land acquisition
- Govt. Grant

Phase I (Total Rs. 10571cr)
- Union Government Equity 14%
- State Government Equity 14%
- JICA Loan 60%
- Property Development 7%

Phase II (Total Rs 19131cr)
- Union Government Equity 21%
- State Government Equity 21%
- JICA Loan 45%
- Property Development 20%
- Interest Free Subordinate Debt towards Land Cost 6%
JICA Loans

- Loan has been accompanied by a series of general contracts going to Japanese firms
- In May 1998- DMRC appointed Japan's Pacific Consultants International (PCI) as general consultant
- The general consultant's role is vital
- It chooses the firm which will finally execute the project

DMRC Tax regime

DMRC pays:
- Wealth Tax
- Fringe Benefit Tax

Exempted from:
- Property Tax
- Sales Tax
- Works’ contract Tax
- Income Tax
- Capital Gains Tax
- Customs
- Excise
## Comparison with DTC

<table>

</tbody>
</table>
Other Concessions to DMRC

- Interest free subordinate loans from:
  - GOI, GNCTD, HUDA, NOIDA
- Concessional loans from Japan International Cooperation Agency (JICA)
- Exchange rate risk is borne by Government
- No dividend is paid on GOI share of equity till the senior debt is repaid fully by the twentieth year
- Electricity at cost to serve basis (300P/kVAh)*

*NDPL Order (FY 2007-08)
REVENUE
Revenue Streams

- Traffic Operations (Fare box, Feeder Bus, Rental)
- Consultancy
- Real Estate
- External Project Works
- Others: Deferred Govt. Grant, Income from sale of carbon credit, Interest from bank, sale of tender documents, etc.

**Rental from Real Estate- How is this included in “Traffic” Operations?**

Removing the Rental portion from Traffic Operations, reduces the proportion of Traffic Operations in the Total Income to 56% (2009-10), 42% (2008-09) and 49% (2007-08) from 71%, 54% and 63% respectively.
### Expenditure

Assuming an average trip length of 17 km
Electricity (fuel) Consumption - Delhi Metro

- Running of Trains
- Air-conditioning of underground stations
- Lighting of Stations
- Lifts, and escalators

Electricity constitutes 25 percent of Operating Cost
Without Subsidy will be even higher
Need to take in to account CO2 emissions and fly ash pollution per KWh of Electricity
Emissions due to Electricity

- In India, 75% of the total power comes from coal-based thermal power plants.
- Thermal Power Plants emit: $\text{CO}_2$, $\text{SO}_2$, $\text{NO}_2$ and Fly ash (Particulate Matter).
- Coal Used in India has higher ash content.
- Only 3% of the fly ash is consumed.
- CDM Report by UNFCC estimates CO2 emissions/passenger-km as 21g for metro (electricity only for trains) and 25g for buses.
- CDM Report assumes a transmission loss of 3.9%.

Carbon Emissions- Delhi Metro

- Electricity Emission Factor = 840 gCO₂/kWh
- Transmission Losses = 30%
- For 490 million units of Electricity consumption per year of DMRC in 2011

\[
\text{CO}_2 \text{ emissions per passenger per day (gm)} = \frac{490,000,000 \times (1 + 0.3) \times 840}{1,600,000 \times 365} \approx 900
\]

- For an average passenger trip length of 17 Km-

\[
\text{CO}_2 \text{ emissions/passenger-km} = 53g
\]

Electricity consumption includes train, air-conditioning of stations etc.

Fare Hike

- March 2004: Min fare from Rs. 4 to 6 (30-50 % increase in fare structure)
- December 2005: Max fare from 14 to 22
- Nov 2009: Min- 6 to 8 and Max- 22 to 30 (average increase of 36 percent in every slab)

Delhi Metro Started in December 2002
IMPACTS

Users vs non users
Households in the vicinity of Delhi Metro Line

- Bus route availability and frequency reduced after the metro for the community
- Bus unavailability to destination increased from 5% to 37% households
- 87% of the respondents had never used the metro

Accessibility of the low-income households in the vicinity of the metro line reduced after the Metro

Results are from a survey of 203 households from low-income settlements in Kailash Nagar and Sukhdev Nagar in 2004
Households Relocated due to Delhi Metro

- The bus route availability and frequency has reduced after relocation: average frequency reducing from 5 min to 63 min (13 times)
- 99% of the households did not have availability/need of using RTVs for access before relocation, but all households use RTV to travel after relocation
- After relocation, cycle rickshaws are available to 28% of the households compared to 93% before relocation
- The daily travel distance after relocation increased from 4.4 Km to 15.4 Km on an average

Accessibility of the low-income households relocated due to Metro also reduced

Results are from a survey of 201 households in Holambi Kalan in North-west periphery of Delhi in 2004
Projected vs. Actual Ridership

50 % of the network under:

- Line-2 (Jahangirpuri – HUDA City Centre)
- Line-3 (Dwarka Sector 9 to NOIDA City Centre)
- Line-4 (Yamuna Bank to Anand Vihar)

accounts for 75% of the total ridership

“The fact that transport modeling for ridership was not carried out accurately by RITES, was accepted by the company (DMRC) as well as the MoUD before the Empowered Group of Secretaries in 2005” - CAG report, 2008

</tr>
<tr>
<td>2010</td>
<td>186</td>
<td>9900</td>
<td>-</td>
</tr>
</tbody>
</table>

- An average of 11,000 passengers per Km of the Metro network
- With Phase III in 2016- total network length ~300 Km
- Average ridership per day in 2016= 3,300,000 => Projected Ridership in 2008 with one-fourth (68 Km) of the network length
Low-Ridership

• Despite low ridership- congestion on the Metro during peak hours
• Congestion was attributable to various factors like-
  ✓ lower number of passenger cars,
  ✓ Suboptimal speed over the rail network,
  ✓ lower frequency of trains, and
  ✓ absence of differential fares during peak hours

Travel Characteristics- Metro Users*

- 48% own two-wheelers and 26% own cars
- Prior mode: Before metro 69% used PT, 2% used para-transit and 29% used private vehicles
- Average daily travel distance for metro users is 36 Km - only 3.2 percent travel up to 10 km
- Average daily cost of travel - Rs 33

* From a survey of 221 metro users at 18 metro stations (Red Line) in 2004
Delhi Metro Demand Estimation

- Model developed in TRIPP, IIT Delhi*:
  - Estimates 21 percent of the ridership projected by DMRC for year 2021 – *close to current ridership pattern*
  - In 2021, Delhi metro would be able to carry 36% trips (maximum) of the total trips made by public transport
  - 64% of public transport trips will be on the bus.

- Model included the effect of:
  - the access and egress trips in terms of distance, time and cost
  - Ratio of access-egress distance and main-haul trip distance-> an important factor

*Advani, M. (2010), Demand estimation for public transport systems - Case Study of Delhi, IIT Delhi, unpublished thesis*
Delhi Metro Demand Estimation

- Study highlighted the importance of cycle-rickshaws as a feeder mode for metro
- 27% to 38% metro trips are dependent on rickshaws
- Policy of Delhi government of restricting rickshaws in several parts of the city

-> will adversely affect metro ridership.
On going Work

- Rebound effect/induced trips
- Modal shifts
- Safety (access/egress trips, along the corridor)
- CO2 emission based on Life –Cycle Analysis
- Expected financing from GOI
- Comparison with road based systems
Issues

- High Capital/Operational and Maintenance Cost: Supported by Govt. Subsidies

- Induced Trips:
  - Auto trips required to access Metro stations
  - Trips on Metro due to availability of a faster mode (wouldn’t be there otherwise)
  - Trips on roads when some auto trips are shifted to Metro
  - Trips by non-metro users due to availability of metro parking lots

Induced Trips “are likely” to nullify the emission and accident reductions due to trips by metro
Issues

• Displacement of Households/ shops
• Permanent Structure (elevated metro) changes the city’s look forever
• Influence Zone: Few corridors, coverage area is less, can’t be changed according to demand
• Access- Egress Inconvenience:
  • Cost of travel: cycle-rickshaw/auto/bus/car/2W
  • Waiting time: for feeder bus
  • No concessional schemes for students or other categories (only 10 percent discount on smart card)
Access- Main Haul - Egress

Access/Egress → Main Haul Trip → Access/Egress

• Mode?
• Cost?
• Convenience?
• Time?

How are these different for bus and metro?
Experience around the world

- By 1999-2000 Kolkata Metro had a ridership of less than 10% of projected.
- US DOT Study of ten rail projects in US: On an average actual ridership was 65 percent lower than forecast.
- TRR Laboratory, UK study of 9 metro systems in developing as well as industrialized nations: Forecast was over 100 percent above the actual ridership.
- Aalborg University, Denmark study of 27 rail projects: For two-thirds of projects, forecasts are overestimated by more than two-thirds.
Experience around the world

TTI Study: In no case has new rail service been shown to have a noticeable impact on highway congestion or air quality
