The UN Environment Economy Division helps governments, local authorities and decision-makers in business and industry to develop and implement policies and practices focusing on sustainable development.

The Division works to promote:

- sustainable consumption and production,
- the efficient use of renewable energy,
- adequate management of chemicals,
- the integration of environmental costs in development policies.

The Office of the Director, located in Paris, coordinates activities through:

- The International Environmental Technology Centre - IETC (Osaka, Shiga), which implements integrated waste, water and disaster management programmes, focusing in particular on Asia.
- Production and Consumption (Paris), which promotes sustainable consumption and production patterns as a contribution to human development through global markets.
- Chemicals (Geneva), which catalyzes global actions to bring about the sound management of chemicals and the improvement of chemical safety worldwide.
- Energy (Paris), which fosters energy and transport policies for sustainable development and encourages investment in renewable energy and energy efficiency.
- OzonAction (Paris), which supports the phase-out of ozone depleting substances in developing countries and countries with economies in transition to ensure implementation of the Montreal Protocol.

- Economics and Trade (Geneva), which helps countries to integrate environmental considerations into economic and trade policies, and works with the finance sector to incorporate sustainable development policies.

UN Environment activities focus on raising awareness, improving the transfer of knowledge and information, fostering technological cooperation and partnerships, and implementing international conventions and agreements.

For more information see [www.unep.org](http://www.unep.org)
The sector specific supplement for metals value chains, as an integral part of the Eco-innovation Manual, has been commissioned by the United Nations Environment Programme (UN Environment) and is the result of close collaboration with International Support for Sustainable Products and Production (isspro).

Lead authors: Sonja Bauer with contributions from Craig Hawthorne and Sanja Uršanić.

Supervision and coordination at UN Environment, Economy Division: Elisa Tonda, Andrea Floudiotis, Liazzat Rabbiosi, and Katie Tuck.

The working version of sector specific supplement for metals value chains was tested during the implementation of the ‘Resource Efficiency and Eco-Innovation in Developing and Transition Economies’ project by project teams of SIRIM Berhad in Malaysia, Egypt National Cleaner Production Centre in Egypt, Centro Nacional de Producción Más Limpia y Tecnologías Ambientales in Colombia, Council for Scientific and Industrial Research in South Africa and CER/Grupo GEA in Peru. UN Environment is grateful for their committed work in testing and applying the eco-innovation manual’s methodology and sector specific supplement with Small and Medium Enterprises for metals value chains in their respective countries and for their invaluable feedback from this experience.

UN Environment acknowledges the following people that provided comments to the preparatory work for the conceptual and methodological formulation of the sector specific supplement of the metals value chains: Craig Jones, Markus Reuter, Tomas Marques, Jakob Johann Fleischmann, Daniel Ayes, Adriana Alzate, Tatiana Botelho, Jorge Perez, Sonia Valdivia, Puji Lestari, Girish Sethi, and Ahn Hak Hoon.

In addition, UN Environment acknowledges the valuable contribution made by the following people: Feng Wang, Faycal Boureima, Vera Barrantes, Kevin Ramirez, Reinhard Joas, Jamie O’Hare, Karina Boers and Helena Rey.

Special thanks also go to the participants of the Regional validation and training workshops in five global regions of Asia Pacific, Africa, Latin America and the Caribbean, Europe and West Asia. Too numerous to mention, their inputs and provision of comments have also significantly helped to tailor this supplement to the needs of the end user.

Design activities were led by Mercè Rua and Adrià Garcia i Mateu from Barcelona-based design collective HOLON.

UN Environment gratefully acknowledges the funding support of the European Commission to the ‘Resource Efficiency and Eco-Innovation in Developing and Transition Economies’ project and related activities.

**BUILD ROADMAP**

- Evaluate the business model concepts and select one to pitch

- Evaluate the benefits
  BM.15

- Evaluate the costs
  BM.16

- Evaluate the risks
  BM.17

- Integrate all the evaluations and make the final selection
  BM.18

- Get senior management approval for the new business model

- Pitch the new business model to the CEO
  BM.19

- Build a roadmap for eco-innovation implementation

- Prepare for the roadmapping workshop
  BR.1

- Do a roadmapping workshop with input from value chain partners
  BR.2

- Define and prioritise the requirements of the first project
  BR.3

**IMPLEMENT**

- Get senior management approval for the implementation roadmap

- Pitch the implementation roadmap to the CEO
  BR.4

- Create a project plan and get it approved

- Create a project plan
  IM.1

- Present the project plan to the Senior Management Team
  IM.2

- Support the implementation activities

- Provide guidance and solve problems
  IM.3

**REVIEW**

- Review the performance of the first project for eco-innovation

- Do a project review workshop
  RE.1

- Do a personal review
  RE.2

- Review the business model and roadmap and agree the next steps

- Review the business model and roadmap
  RE.3

- Present the review conclusions and agree next steps with the CEO
  RE.4
Introduction

Metals are a key resource in the modern world and are constantly being modified to meet new demands in every area of engineering and technology. Various types of metals, e.g. ferrous and non-ferrous, are commonly used in different applications depending on specific metals properties to fulfil desired requirements.

This supplement will focus on highlighting eco-innovation opportunities along the metals value chain including fabrication, manufacturing, use and recycling (dashed lined in Figure 1). Though mining, refining, and metals processing will not be specifically addressed in this supplement, they are important in this context since they are linked to specific trends and related sustainability challenges relevant for the downstream metal value chain, e.g. raw material scarcity, energy intensity, working conditions in the extraction industry.

Building on these principles and the methodology presented in the Eco-innovation Manual, this supplement provides specific information to advance eco-innovation with companies in this metal products’ value chain. It is complementary to the Eco-innovation Manual and not a stand-alone guide. Similar to the Eco-innovation Manual, this supplement makes use of a learning case study of a fictional company in a developing country, BikeBizz Co. to illustrate the implementation of the eco-innovation methodology and selected templates applicable to the metal value chain.
PREPARE

Prepare to engage a Company and its value chain and build the potential Company’s interest in the rewards available from eco-innovation.
PR.1
Evaluate potential markets
**PR.1 Evaluate potential markets**

**TIPS & TRICKS**

**GUIDE COMPANY SELECTION USING TARGETED QUESTIONS**
You may consider using the following questions to help identify the type of company you should be targeting in the selected markets:

- Which end markets are most attractive from a Value Proposition perspective?
- What type of companies in the metals value chain are providing goods or services to these end markets and where are they located in the value chain?
- Which value chain steps create the most value? Based on this, you can pose some additional company specific questions:
  - What key sustainability capabilities can metals sector companies in these value chains or markets offer to achieve a competitive advantage?
  - What is the potential for the metals sector company to engage value chain partners and offer sustainable solutions to end markets?

**USE ENVIRONMENTAL IMPACT DATA TO SELECT RELEVANT SUB-SECTORS TO TARGET**
Table 1 provides information on the environmental impacts of specific subsectors in the metals sector, which can help with the market-level analysis described in the Eco-innovation Manual. For example, the manufacturing of electrical equipment tends to have high environmental impacts, with respect to energy and water consumption as well as waste water and CO₂ emissions, whereas the fabrication of metal products tends to have high environmental impacts with respect to material and water consumption.

Table 1: Comparison of resource efficiency and environmental impact of metals industry subsectors
(Note: Rankings are based on data from Germany, 2010 [VDI, 2013])

<table>
<thead>
<tr>

</table>

Notes: The ranking is assigned vertically. The highest ranking means that subsector has the highest resource intensity and therefore the highest environmental impact for that category. (1=lowest impact, 6=highest impact).
PR.1 Evaluate potential markets

**TAP INTO CONSUMER DEMAND**
End-market demand in the metals value chain is showing a growing need to address sustainability challenges arising from emerging trends such as urbanization and changing consumption patterns (e.g. consumer lifestyle). It is therefore possible to picture opportunities for companies in the metals value chain in supplying the expanding sustainable buildings end-market. This includes mainstreaming a range of regionally appropriate practices and technologies that promote on-site renewable energy, water, and resource efficiency. More specifically, this could mean an expansion of the market for renewable, recycled and resource efficient metal materials and the development of newer, more durable, and high-strength metal products, as well as an increasing demand for energy efficient cooling and heating technologies, etc.

**CONSIDER MULTIPLE ECO-INNOVATION OPPORTUNITIES IN AN EXPANDED METALS VALUE CHAIN**
The various metals value chain subsectors serve a wide spectrum of end markets linked to economic development, such as the automotive, construction, energy, electrical & electronic equipment (EEE) industries. An example of a viable market for eco-innovation implementation services could be companies servicing the automotive industry, since this sector is faced with many pressures (e.g. regulation, market demand, health and environmental issues, profitability) that drive the industry to deliver new sustainable mobility solutions. Companies that wish to cooperate with the automotive industry need to find alternative solutions (e.g. products and services) and create business models that can save resources, improve recycling strategies, and increase profitability. The metals sector has highly integrated and globalized value chains, thereby providing opportunities for developing and emerging economies to access local markets as well as regional and international export markets.

**UNDERSTAND THE SUSTAINABILITY CRITERIA USED BY CUSTOMERS**
When performing your market research, you may also identify how customers judge sustainability performance and whether they have established certain sustainability criteria. For example, the EU market offers potential for export manufacturers of metal parts and components that are able to supply advanced components customized according to the need of end-users, especially if they are able to do coating treatments in-house, following process certification according to ISO 14001 and being compliant with the RoHS Directive.
Most metals are used in alloy form, which is a material composed of two or more metals, or a metal and a non-metal. The metal life cycle starts with mining of raw material (i.e. metal ores) and refining them for the process of primary metal manufacturing. The primary metals (e.g. iron, steel and ferro-alloys, and non-ferrous metals: aluminium, lead, zinc, tin, copper, etc.) go through processes of fabrication and/or manufacturing resulting in different metal end products ready for use that are provided to business customers as well as consumers. Once metal products have reached the end-of-life, they can be recycled, used in cycles of another metal, such as copper wires mixed into steel scrap, or disposed at the landfill as waste. Figure 1 provides a simplified metal life cycle, including how discarded material enters the cycle of another metal since many end products (e.g. automobiles, EEE, etc.) usually consist of different materials including diverse metals. However, it is important to mention that the metals life cycle can take different paths depending on types of metals and end products.

Figure 1. Simplified metal life cycle including interaction of different metals (adapted from [UN Environment Metals, 2011]). The dashed box demarcates the phases of the metal life cycle that are the focus of this supplement.
Figure 2 illustrates specific processes within fabrication and manufacturing and provides a non-exhaustive list of some product, production and management opportunities for particular processes including management and design aspects of the production.

### Treatment processes

**Surface preparation**
- Mechanical industrial cleaning
- Chemical cleaning

**Heart treatment**
- Annealing
- Martensite formation in steel
- Surface hardening

**Finishing**
- Electroplating
- Painting
- Conversion coating
- Diffusion and ion implantation
- Vapor deposition processes
- Organic coating
- Thermal and mechanical coating processes

### Shaping

**Forming**
- Bulk deformation: Rolling / Forging / Extrusion / (Wire) drawing
  - Sheet metalworking: Bending / (Deep) drawing / Shearing
  - Powered metallurgy: Powered production / Powered compaction/pressing / Sintering
  - Casting: Expandable-mold casting / Permanen-mold casting

**Surface preparation / Heat treatments / Finishing**

### Material removal

**Forming**
- Turning / Drilling / Milling
  - Powered metallurgy: Grinding
  - Casting: Mechanical energy processes / Electrochemical machining / Thermal energy processes / Chemical machining

**Surface preparation / Heat treatments / Finishing**

### Assembly

**Welding**
- Arc welding / resistance welding / Oxyfuel welding / Other fusion-welding processes / Solid state welding
  - Brazing, soldering and adhesive bonding
  - Mechanical assembly: Threaded fasteners / Rivets and eyelets / Interface fits / Stitching, stapling and sewing / Molding inserts and integral fasteners

**Surface preparation / Heat treatments / Finishing**

Figure 2: Overview of manufacturing categories and sub-processes in the metal processing sector (fabrication and manufacturing)
### ISIC Code & General Description

**C24 – Manufacture of basic metals**

This division includes the activities of smelting and/or refining ferrous and non-ferrous metals from ore, pig or scrap, using electro-metallurgic and other process metallurgic techniques. This division also includes the production of metal alloys and super-alloys by introducing other chemical elements to pure metals. The output of smelting and refining, usually in ingot form, is used in rolling, drawing and extruding operations to make products such as plate, sheet, strip, bars, rods, wire, tubes, and pipes as well as hollow profiles. Further, the output can also be in molten form in order to make castings and other basic metal products.

- Production of granular iron and iron powder
- Production of steel in ingots or other primary forms
- Production of semi-finished products of steel
- Manufacture of hot-rolled and cold-rolled flat-rolled products of steel
- Manufacture of hot-rolled bars and rods of steel

**C25 – Manufacture of fabricated metal products**

This division includes the manufacture of “pure” metal products, such as parts, containers and structures, usually with a static, fixed function, as opposed to the following divisions 26-30, which cover the manufacture of combinations or assemblies of such metal products, sometimes in combination with other materials, into more complex units that, unless purely electrical, electronic or optical, work with any moving parts.

- Manufacture of structural metal products
- Manufacture of tanks, reservoirs and containers of metal
- Manufacture of steam generators, except central heating hot water boilers
- Forging, pressing, stamping and roll-forming of metal; machining
- Treatment and coating of metals

PR.2
Building the right internal team
ENSURE TEAM HAS SKILLS FUNDAMENTAL FOR THE METALS SECTOR
In order to capture a company’s performance and implement eco-innovation, it is important to have expertise in your team for the metal manufacturing markets you are targeting. This will enable your team to accurately identify the most important sustainability impacts as well as identify feasible business opportunities and innovations. The metalworking industry is complex and varied and you will most likely need different experts for different subsectors. Such experts can be identified using the Life cycle Stakeholders template explained in PR.3 Building the right external partnerships. Involving material suppliers for instance can allow for the understanding of the manufacturing processes and error tracking of the final product. Additionally, having experts with specific know-how for the target markets will provide you with credibility when approaching companies to market your services. The team should include some skills important for the metals sector, such as proficiency in:

• Auditing companies manufacturing metal products
• Implementing common business models and business practices in the metals sector
• Plant safety risk assessments (Occupational Health & Safety)
• The Globally Harmonized System of Classification and Labelling of Chemicals (GHS) – in case of subsectors involved with chemicals, such as metal surface treatment

Building the right external partnerships

BACKGROUND INFORMATION

Examples of collaboration along the supply chain

An example of collaboration along the supply chain can be found in the US auto sector, where the Automotive Industry Action Group (AIAG) encourages its members to report in accordance with the GRI Sustainability Reporting Framework and provides GRI trainings to its members. For increased sustainability in the supply chain “AIAG drives a common process among its member companies to incorporate environmental sustainability throughout the supply chain – whether through the development of common tools for reporting and data collection, or taking a more comprehensive approach to addressing sustainability at an organizational level”.

The UltraLight Steel Auto Body (ULSAB) sheet steel production industry initiative is another inter-industry example. It illustrates how companies in this sector joined and worked together to develop and promote stronger and lighter auto bodies providing answers to the challenges of the automotive industry around the world, regarding weight reduction of steel auto body structures while maintaining the performance and affordability and improving sustainability performance across the value chain.

The E-TASC Tool of the Global e-Sustainability Initiative (Electronics – Tool for Accountable Supply Chains), launched in 2007 by the Global e-Sustainability Initiative (GeSI) and the Electronics Industry Citizenship Coalition (EICC) is a web-based tool for companies to “manage their own factories, communicate with their customers, and assess their suppliers on corporate responsibility risks”. In the tool, companies fill in a questionnaire, which are then shared with multiple participating customers. It includes a risk assessment and examples of best practices to help companies improve performance.

The Steel and Metal Industry in Berlin-Brandenburg (Germany) is a network comprising over 60 companies and institutions of the steel and metals industry, from actual metal production to final processing. Several universities and research organisations are affiliated to the cluster and provide information and support due to the highly qualified workers and trainers. Breaking down market access barriers, establishing supply and value chains, and developing successful strategies for the maintenance of qualified employees are topics in the focus of the networks’ activities.

Additional examples of metals sector specific partnerships:

- **Green Supply Programme**
  A public-private partnership from Mexico implemented in the automotive supply chain throughout the country to reduce environmental impacts from the automotive manufacturing industry while enhancing competitiveness – For more info see the UN Environment Business case for Eco-innovation.

- **COBALT**
  The COBALT project offers a platform for a debate on sustainable raw materials used between different stakeholders in order to facilitate the sustainable management of raw materials. Available at: www.cobalt-fp7.eu/

- **Corporate Open Innovation Platform**
  The platform helps clean-tech start-ups, universities and research labs to become more sustainable.

**PR.4 Identify sustainability hotspots across the value chain**

**LEARNING CASE STUDY OF LIFE CYCLE THINKING**

As a summary of the filled template showed below, some sustainability challenges and opportunities that a small metal producer might be facing are:

Sustainability hotspots (economic, environmental, social) for metal manufacturers are:

- Raw material scarcity and price volatility of metals (economic, environmental)
- Consumers are becoming increasingly aware of the mining conditions and want to ensure their products are sustainably sourced (environmental, social)
- Raw metals production consumes a lot of energy (economic, environmental)
- Inefficient use of metal feedstock and generation of metal waste along the metal value chain (economic, environmental)
- Health concerns related to hazardous substances used for the metal processing/treatment and paints (e.g. lead is used in bright colours) (environmental, social)
- Generation of hazardous waste related to electroplating and painting processes along the value chain (economic, environmental)
- Increasing concerns about health impacts for society and the environment due to the release of hazardous substances (e.g. lead containing compounds) from metal products after disposal (environmental, social)

## PR.4 Identify sustainability hotspots across the value chain

### Production processes

<table>
<thead>
<tr>
<th>Sustainability opportunities</th>
</tr>
</thead>
</table>
| **Material removal** (conventional machining, abrasive processes, non-traditional machining) | **Energy efficiency:**  
  • Speed-controlled ventilator instead of conventional compression cooler which reduces power consumption by 70%  
  
  **Material efficiency:**  
  • Punching without generating sheet skeleton by re-positioning sheet on worktop  
  • Use of alternative, material saving manufacturing processes (e.g. casting instead of machining part out of bulk material)  
  • Reduction of reject  
  
  **In general:**  
  • Reduce process steps  
  • Reduce lubricants,  
  • Use water-based lubricants with biopolymers as they are more environmentally friendly, render machines easier and also provide cooling  |
| **Assembly (Welding, brazing, soldering, adhesive bonding, mechanical assembly)** | **Energy efficiency:**  
  • Soldering instead of brazing where possible (lower energy input)  
  • Use of different filler wire for welding which requires less energy to melt  
  
  **Material efficiency:**  
  • Use welding process which does not require the adding of filler wire where possible  
  • Alternative design for use of less filler wire or adhesive  
  
  **In general:**  
  • Substitute welding material/consumable with a lower fume-generating or a less toxic one  
  • Local exhaust ventilation systems for alloys (e.g. prevent Cr(VI) exposure  |
| **Surface preparation and cleaning** | **Material efficiency (water, chemicals):**  
  • Counter-rinse processes  
  • Cleaning optimisation (e.g. temperature, contacting)  
  • Reduce grease on surface in prior steps (e.g. optimise machining, cooperate with metal suppliers)  
  • Use enclosed cleaning machines (e.g. VOC capture & reuse)  
  
  **Safer chemicals:**  
  • Replace with mechanical cleaning  
  • Substitution with safer chemicals  
  
  **In general:**  
  • Substitute welding material/consumable with a lower fume-generating or a less toxic one  
  • Local exhaust ventilation systems for alloys (e.g. prevent Cr(VI) exposure  |
PR.4 Identify sustainability hotspots across the value chain

<table>
<thead>
<tr>
<th>Production processes</th>
<th>Sustainability opportunities</th>
</tr>
</thead>
</table>
| Finishing (electroplating, coating, paint application) | **Energy efficiency:**  
- Optimisation of plating temperature and general process conditions  
**Material efficiency:**  
- Plating internal recycling/filtration and reuse of plating bath  
- Plating external recycling of plating bath and recovery of sludge metals  
- Switch paint application technique (e.g. dipping vs. spray), HVLP, electrostatic or powder coating  
- Reduce overspray for painting: e.g. switch to HVLP spray or electrostatic spray for higher efficiencies  
- Optimize existing equipment by implementing SOP’s and training programme  
- Reduce waste: use heated hose for paint supply for two-component paints  
- Alternatives to solvent-based paint application: buy pre-painted parts, UV-paints, water-based paints, etc.  
**Various:**  
- Reduce cleaning and preparation steps |
| Heat treatment | **Energy efficiency:**  
- Measurement of part temperature for optimizing treatment temperature and residence time  
- Heat recovery from water (for low-carbon steel), oil (for high-carbon steel) or air quenching  
- Direct hardening of steel heated by the forging process  
- Reducing losses during pre-treatment, i.e. cleaning and drying, by using a closed system for cleaning with an integrated vacuum system for drying whereby the cleaning fluid is warmed up by waste heat from the furnace, so no additional heat for drying needs to be provided  
- Bringing warm rolled metal sheets directly to the heat treatment furnace, which is possible through temperature measurement of the furnace and sheets for being able to regulate the furnace |
### Design

**Life cycle design for sustainability**
- Material saving design through using for instance design parts which can be cast rather than parts that need to be machined out of bulk material
- Favour the use of materials whose procurement does not harm the environment or people
- Energy saving design through for instance involving less energy intensive production steps and a lower number of production steps
- Design for reparability and recyclability

### Management opportunities

**Sustainable procurement**
- Choose input material carefully
- Main inputs are: ferrous, non-ferrous metals, chemicals (cleaning agents, paints, plating), packaging material, additives and working materials: heat-transfer medium, lubricants, transformer fluids
- Increase use of renewable and recyclable materials
- Substitute hazardous materials

**Material management**
- Reduce the use of materials
- Reduce lost materials

**Manufacturing process**
- Reduce water use
- Increase energy efficiency
- Reduce emissions
- Comply to regulations
- Technical assistance

**Logistics**
- Lean manufacturing system
- Integrated on-line logistics system
- Environmental management systems, environmental strategies and monitoring

**Waste management**
- Prevention, reduction, collection, separation, recycling
- Possibility to recycle hazardous waste or use it for energy production

**PR.5** Identify the general opportunities and threats across the value chain

**TIPS & TRICKS**

**CONSIDER KEY DRIVERS FOR ECO-INNOVATION IN METALS VALUE CHAIN**

Some key drivers that provide challenges and opportunities across the product life cycle in the metals sector include:

- Metal sector market considerations:
  - Economic effects e.g. price fluctuation and material availability
  - Restricted substances either regional or for export
  - Consumer trends e.g. retail sector, sustainable sourced products
  - Geo-political e.g. conflict minerals
  - Specific regulations supporting eco-innovation, e.g. pollution control (VOCs, waste water), waste management, recycling, hazardous substances, resource efficiency (material, energy), OHS (occupational health and safety), industry standards (e.g. automotive), sustainable procurement, etc.

- Supply chain pressures, e.g. eco-labels, sustainability reporting, industry initiatives such as the Aluminum Stewardship Initiative (ASI) from Switzerland, led by several key industry players (among others AUDI, BMW, Jaguar Land Rover, Nespresso, Tetra Pak); the ASI seeks to mobilise a broad base of stakeholders to foster greater sustainability and transparency throughout the aluminium industry

- Particular partnership patterns e.g. eco-industrial parks, business clusters, etc. (see *Background information of activity PR.3 Building the right external partnerships*).

The following example from the metals sector illustrates how a company introduced an eco-innovation approach in order to access new markets.

**Industry example 1: Access to new markets**

Adelca, Ecuador is a manufacturer of primarily fabricated structural steel products such as cold-drawn rebar, section profiles, annealed and galvanized wire, etc. that are commonly used in construction or the fabrication of finished products. The company changed their strategy to producing steel products made from 100% recycled steel with an emphasis on excellence in service as well as exporting specific product lines that fulfil international quality standards to neighbouring markets.

Since Adelca’s demand for scrap metal to produce recycled steel products was higher than the locally available supply, the company modified its business model to focus on increasing the amount of scrap steel recovered from end users and invested in building up its network of recyclers. This included supporting the establishment of collection centres, donating metal cutting equipment, offering loans, and paying the best price for the scrap metal provided. Adelca improved the safe and effective management of scrap steel by investing in the training of the network of scrap steel suppliers in efficient technologies and environmentally sound practices.
Another key component of Adelca’s business model is the monitoring and integration of customers and suppliers needs through satisfaction surveys.

**ECONOMIC BENEFITS**
- Savings of US$ 12 million on the 20,000 tons of steel the company produces every month
- Recyclers network income exceeding US$ 1 million per month

**ENVIRONMENTAL AND SOCIAL BENEFITS**
- Savings result from each ton of recycled steel compared to virgin steel:
  - 1.5t iron ore and 0.5t coal saved
  - 40% less water, 75% less energy
  - 86% less air pollution
  - 76% less water pollution
- Integrated management systems: OHSAS 18001, ISO: 9001 and 14001 promoting continuous improvement in safety and environmental standards
- Company’s recyclers network generates around 4,000 jobs (direct and indirect)

**PR.5 Identify the general opportunities and threats across the value chain**
**Identify the general opportunities and threats across the value chain**

**LEARNING CASE STUDY OF PESTEL**

To convince your potential clients to engage in eco-innovation you should be well informed about the particular market and should be able to address the sustainability hotspots and more general sources of threats and opportunities faced in the market and the company. The PESTEL template can be used to analyse external environmental threads and opportunities for the company. The ‘significant’ threats and opportunities are those that score 9 or above and are highlighted in yellow.

→ Refer to ‘Background Information’ for a list of selected legislations supporting eco-innovation in the metals sector.

PR.5 Identify the general opportunities and threats across the value chain

Table 4 presents opportunities for businesses, including SMEs, to take advantage of different economic areas along the value chain (from extraction to manufacturing to end-of-life recovery). The areas are further categorized according to regional relevance (Asia, Latin America, Africa and Africa) and some indicative examples are provided. For all three regions, eco-innovation opportunities reside in new materials and new applications of materials, as well as manufacturing resource efficiency technologies and providing energy efficient solutions (often regionally tailored). For example, ‘sustainable product design’ is of high relevance in Asia, medium relevance in Latin America, and of low relevance in Africa.

Table 4: Overview of general opportunities for eco-innovation in the metals industry value chain for the Asian, African and Latin American regions [EIO, 2013] (colour coding below)

**PR.5 Identify the general opportunities and threats across the value chain**

**Examples of selected legislations supporting eco-innovation in the metals industry**

Relevant international conventions:

- Another example is the Minamata Convention, which aims at curtailing the emissions of mercury on a global level. From 2020 onwards, particular mercury-containing products will be prohibited and health and safety measures have to be implemented. Industries in the contracting states are obliged to reduce their mercury emissions significantly.

Relevant regional regulations: European Union:

- Concerning waste electrical and electronic equipment (WEEE), the WEEE Directive and the RoHS Directive (restriction of the use of certain hazardous substances in electrical and electronic equipment) aim at establishing environmentally friendly disposal and recovery of electric and electronic disused devices. Producers of electric and electronic equipment are obliged to collect the products at their life cycle end and reuse, recycle or dispose them in an ecological manner. The RoHS Directive prohibits the use of certain heavy metals in the equipment in order to enhance the recyclability of WEEE.

- The regulation on the Registration, Evaluation, Authorisation and Restriction of Chemical substances (REACH) calls for the substitution of the most dangerous chemicals when suitable alternatives have been identified. This is specifically relevant for the metal treatment companies, which use chemicals in their processes. Therefore, REACH requests the industries to develop stronger relationships and better understanding on how chemicals are used.

- Greenhouse gas emissions are controlled by, amongst others, the EU Industrial Emissions Directive (IED) as well as the EU Emissions Trading System (EU ETS).

- The F-Gas Regulation on certain fluorinated GHGs implements the Kyoto Protocol. Every producer, importer and exporter of these gases is required to report to the commission and the national authority to enable them to control the implementation of the guidelines.

- Eco-design Directive, aimed to encourage energy efficiency, is also enforcing other environmental considerations including: materials use, waste issues and recyclability. These are specifically relevant for the cooling equipment also refrigerants (chemicals) therefore companies with innovative products that meet these standards will enhance access to EU export market, but also others with strict regulations. And in addition this is linked to the F-gas regulation and the Montreal Protocol.
Example of national legislation relevant for the metals sector: USA:

- Important to mention is the Dodd-Frank Wall Street Reform and Consumer Protection Act. Companies are obliged to disclose to the public the use of so-called conflict minerals, such as tin, wolframite, gold, and tantalum from the Democratic Republic of the Congo or its neighbouring countries. Similar regulations are being drafted in the European Union.
- Therefore, companies exporting to the US and EU have to be aware of these regulations, as a proof of the origin of these minerals is requested in case conflict materials are part of the products.

Example of national chemicals related legislation relevant for the metals sector: China

- In June of 2010, the Ministry of Environmental Protection in China adopted the Provisions on Environmental Regulations of New Chemical Substances, replacing a previous regulation from 2003. The 2010 regulations are similar to the EU’s REACH and are known as “China REACH”.

PR.6
Develop a value chain vision
Developing a value chain vision

**Threats and opportunities**

**Vision**

The metal manufacturing industry is successful, profitable and growing strong in both domestic and international markets.

There are overarching pressures having strong influence on the metal manufacturing value chain such as a stricter regulatory environment, market demand for sustainable products, health and environmental issues related to metal manufacturing industry and often above all the need to ensure profitability. Volatile prices of raw materials caused by their scarcity and other global geopolitical issues encourage metal manufacturing value chain companies to start thinking about new ways to overcome these emerging challenges.

Enhanced and innovative cooperation between different metal value chain stakeholders is recognized as a solution with high potential to address the aforementioned challenges and lead to a significant decrease in raw materials consumption and emissions generation. Furthermore, innovative business models often include solutions addressing issues from all three aspects of sustainability to incorporate environmental impact reduction and health and social risks from operations, whilst increasing profitability for all involved stakeholders.

PR.9
Pitching the benefits of eco-innovation to the CEO
**PR.9 Pitching the benefits of eco-innovation to the CEO**

**BACKGROUND INFORMATION**

At this point of the eco-innovation process, you have gathered all the necessary information on the target value chain and are ready to engage a company to offer your services as an eco-innovation service provider. From this point onwards in the supplement, we will use the hypothetical company BikeBizz Co. as a learning case study to provide practical examples of implementation of the eco-innovation methodology and selected templates at a company within the metals value chain.

**Description of the BikeBizz Co.**

The results of your desktop research and the completion of the eco-innovation Target Identification template identified the sector fabrication of metal products as a key sector that would benefit from eco-innovation services. The bicycle market in particular is currently showing signs of growth, in particular consumers are putting more value on high quality and sustainably produced bicycles.

After attending a local trade fair of manufacturers and wholesalers of bicycles and related parts, you identified the BikeBizz Co. as an ideal candidate for the implementation of eco-innovation due to its strategic position in the value chain, good position in the local market and as well its forward-thinking management team.

BikeBizz Co. is a small company specialized in the production of standard bicycles offering customization on customers demand.

The company was established by a cycling fan to produce bikes for the local market. The company employs 25 people and produces around 1500 bicycles per year.

BikeBizz Co. builds the frames including fork and handlebar out of purchased steel tubes and applies a corrosion protective coating and a final coating of paint. The company also produces the spokes out of steel wire, which are assembled with the other purchased wheel components. The finished wheel is balanced. Finally, the frame and wheels are assembled with the other bike components, also acquired from suppliers. The bicycles can be adjusted to customers’ specific requests including for example frame design customisation to fit different applications (e.g. freight transportation).

The bikes are predominately sold to the local market through their small retail shop. A small percentage of their bikes are exported to a neighbouring country.

The majority of the employees are involved in the production processes (e.g. frame building, assembling, finishing). The management staff, altogether three, includes the director, the sales and customers’ manager and the finance officer. They also have a salesperson running their retail shop.

Now that you have identified some key sustainability challenges and opportunities faced by the Company, you can use the output from the Life cycle Stakeholders template to help you identify the key partners with whom you could engage to offer eco-innovation solutions (see PR.3).

The following list describes how some stakeholders could potentially contribute to eco-innovation activities in the value chain:

Based on the completed Life cycle Stakeholders template for the BikeBizz Co., the key partners include:

- Suppliers of metal raw materials (e.g. tubes) and parts – ensure metals are sustainably sourced and optimize mechanical properties for production and use over the product’s lifetime.

---

8 http://www.cbi.eu/market-information/metal-parts-components/metal-parts-bicycles
Pitching the benefits of eco-innovation to the CEO

- Equipment suppliers – optimize resource efficiency of existing equipment; potential application of 3D printing and additive manufacturing to significantly improve material efficiency
- Chemical suppliers – improve corrosion protection and extend the durability of the bike; eliminate heavy metal containing pigments (e.g. lead-containing pigments)
- Customers – involve customers in workshops to assist in identifying key bike features and functions, as well as determining desirable payment schemes.

Your brief analysis of the subsectors of the metals sector produced the following representative life cycle diagram related to the life cycle of bicycles.

**Market opportunities for bicycle manufacturers**

- Using sustainable materials: recycled metals, solvent-free and lead-free paints, natural rubber tyres or made from recycled material
- Application of alternative metal processing techniques and materials to reduce energy consumption and improve material efficiency
- Design for reparability and recyclability
- Cooperating with a local NGO contributing to improving life quality of local populations or involved in the sustainable transportation initiatives offering sustainably produced metal products/bikes (e.g. partnering in awareness raising and creating better visibility, possible revenue stream)
- Diversifying into the production of bikes used for other uses (e.g. multi-purpose bikes), offering maintenance services (directly or through repair shops)

![Figure 6 Representative life cycle diagram for the bike market](image-url)
The aim of the SET STRATEGY phase is to use your knowledge of the company’s strengths, weaknesses, opportunities and threats to propose a new business strategy that places eco-innovation at the core of the company’s business strategy to ensure progress towards a sustainable future for the company.

ST.3
Capture the current business model
LEARNING CASE STUDY OF BUSINESS MODEL CANVAS

The BikeBizz Co.’s current business model is based on the Value Proposition of locally produced, good quality bicycles adapted to specific customer requirements at an affordable price. The key activities of the company are manufacturing the bicycle frame out of acquired steel tubes, providing surface treatment, corrosion protection and painting for the frame, producing the spokes out of steel wire and assembling them with the other purchased wheel components as well as balancing the finished wheel, and finally assembling the frame and wheels with the other bike components, also acquired from suppliers. The bicycles can be adjusted to customers’ specific requests.

Further key activities are selling the bikes in their own small bike shop. Thus, the key partners of the company are the partnering store in the border region, the suppliers of semi-finished products and components. The key resources are the production machines, the acquired bicycle parts and the skilled staff. The biggest customer segment is constituted by the local customers, the customer relationships are mostly maintained by direct communication and the channels to the customers include media adverts, direct sale and export. The main costs for the company accrue from material procurement, electricity demand and staff expenditures, while the revenue is solely obtained from bike sales.

ST.4
Do a Walk-Through Audit
**ST.4 Do a Walk-Through Audit**

**TIPS & TRICKS**

**PERFORM A SIMPLIFIED VALUE-STREAM MAPPING AS PART OF THE WALK-THROUGH AUDIT**
It is possible for you to use a simplified value stream mapping method (see US EPA Lean and Environment Toolkit) to characterise the whole business process from customer order to product/service delivery.

**CONSIDER KPIS AND BENCHMARKS**
Try to gather data during the audit that could enable you to evaluate important metals sector manufacturing Key Performance Indicators (KPIs) for the company. Such KPIs cover topics including process efficiency (value-added time/total lead time), recyclability, and overall equipment efficiency – further examples of KPIs for the metals sector are provided in the Background Information section. Moreover benchmarking against best practice standards (e.g. world class process cycle efficiencies can exceed 25%) can be useful to identify priority areas for operational improvement.

**TRY TO IDENTIFY CHEMICAL-RELATED RISKS AND HAZARDS**
Information on hazards and risks related to chemicals used/handled, stored at the production site (e.g. cleaning agents, paints, lubricants, etc.) are explained on hazard/risk labels and in Safety Data Sheets (SDS) that should be made available by the company’s suppliers. This information can help you to understand and identify any safety or occupational health related issues to be considered in order to improve the situation of the workers and also other value chain stakeholders (transporters, customers, communities).

**CONSIDER CUSTOMERS SPECIFIC REQUESTS**
When completing the activity ST.4 Walk-through Audit, you can also ask the company about specific requests from customers or other stakeholders regarding environmental performances and quality of products or operations, such as:
- Carbon/water/chemical footprint
- VOC-free formulations (e.g. coatings, inks)
- Heavy-metal free products (e.g. lead-free paints)
- Compliance with national laws on workplace health and safety policies (e.g. VOC fugitive emissions)
- Disposal or valorisation of hazardous waste (e.g. paint overspray sludge)
# LEARNING CASE STUDY WALK-THROUGH AUDIT RESULTS

## Operational Strengths
1. operates with an effective and skilled team

## Operational Weaknesses
1. The paint pigments applied by hand spraying, for which the material efficiency was estimated to be about 40%

## Key observations

**General aspects**
- The bicycle manufacturing process basically consists of frame manufacturing and painting, wheel manufacturing, bike assembly as well as packaging.

**Sales & Marketing**
- Relationship with customers and other stakeholders are well established

**Design & Engineering**
- Open to offer customised design solutions upon customer’s request

**Production — goods in**
- Frame is manufactured from steel tubes acquired from suppliers.

**Production — main processes**
- Large amounts of hazardous wastes (lubricants/swarf sludge, over spray sludge)
- Occupational health issues related to finishing processes (e.g. VOC emissions, lead paint)

**Production — goods out**
- The finished bike is packed and can be delivered to the customer.

**Purchasing**
- Lack a production manager and do not have time to map the different process steps.
ST.4 Do a Walk-Through Audit

Figure 4: Bicycle production operations overview at the BikeBizz Co. including inputs and outputs (inventory stock between each step)
ST.4 Do a Walk-Through Audit

From the Life-cycle Thinking template, the results of the PESTEL and the Walk-Through Audit, the main sustainability challenges and opportunities along the life cycle of the bicycle, the so-called sustainability hotspots, are identified:

- Growing demand for affordable, high quality forms of transportation (e.g. bikes) in local market
- Competition from low-cost international companies putting pressure on market share
- Increasing costs of energy and process agents in the metal fabrication production
- Growing demand for sustainable products and services in the bicycle production
- Increasing interest from long-term investors in companies involved in sustainable production
- Waste generation along the bicycle life cycle (raw materials extraction and production, end-of-life bicycles)
- Health and safety issues along the life cycle of the product
- Lack of recycling infrastructure for different waste streams (metals, hazardous waste)
Table 6 presents examples of different indicators to measure sustainability in the metals sector. Elements in bold indicate important KPI’s for the metals sector.

ST.6 Update the sustainability hotspots

As pointed out in the Eco-innovation Manual, an important part of understanding the operational performance of the company is to gather data about the life cycle sustainability impacts of the products the company offers and update the sustainability hotspots that you identified during the PREPARE phase. These data should be captured by updating the Life-cycle-Thinking template already completed in the PREPARE phase for the value chain, thus the updated Life-cycle Thinking template just presented.

With updated information about the sustainability impacts, you can now also update the sustainability hotspots. The following table illustrates the sustainability hotspots identified for the BikeBizz Co. along with some of the key stakeholders and ideas for how they could help to address these hotspots.

Table 7: Identified sustainability hotspots and how stakeholders could help

<table>
<thead>
<tr>
<th>Sustainability hotspot</th>
<th>Stakeholder and how they could help</th>
</tr>
</thead>
<tbody>
<tr>
<td>growing demand for affordable, high quality forms of transportation (e.g. bikes) in local market</td>
<td>• customer- willingness to pay a higher price</td>
</tr>
</tbody>
</table>
| competition from low-cost international companies putting pressure on market share | • manufacturer- new production methods for higher metal utilization and less metal waste for higher utilization rates and better competition  
• manufacturer- diversification  
• manufacturer- using high quality and close production site as selling point  
• investors/local community- invest in local company to ensure good competition on the global market |
| increasing costs of energy and process agents in the metal fabrication processes | • manufacturer- more sustainable manufacturing processes                                               |
| growing demand for sustainable products and services in the bicycle production | • customer- willingness to pay higher prices  
• manufacturer- use the demand for high quality products as selling point: advertise sustainability and local production |
| increased interest of the long-term investors in companies involved in sustainable production | • recycling company- recycling strategies to decrease the amount of metals dumped after use            |
## ST.6 Update the sustainability hotspots

<table>
<thead>
<tr>
<th>Sustainability hotspot</th>
<th>Stakeholder and how they could help</th>
</tr>
</thead>
</table>
| waste generation along the bicycle life cycle (raw materials extraction and production, production, end-of-life bicycles) | • suppliers- more sustainable extraction methods; less use of natural area  
• manufacturers- more sustainable use of raw materials, paints, hazardous substances  
• recycling company/customer- take back actions for high metal return for recycling instead of dumping  
• recycling company – recycling strategies to decrease the amount of metals dumped after use |
| health and safety issues along the life cycle of the product                            | • extraction site managers- allow for better health insurances  
• manufacturer- higher standards of work place safety and health issues                                                                                                           |
| lack of recycling infrastructure for different waste streams (metals, hazardous waste) | • manufacturer/recycling company: new recycling methods; new metal formulations for better separation and recycling; more sustainable use of hazardous substances; processes for internal reuse of hazardous substances |

Develop a vision for the company
LEARNING CASE STUDY OF COMPANY VISION

Company vision

BikeBizz Co. is a leader in a new and growing market specialized in the production of standard bicycles offering customization on demand. The aim is to specialise in manufacturing and selling sustainable bicycles with added-value services and accessories customized on demand. BikeBizz provides the customer with an enhanced cycling experience since the bike geometry (frame, seat, handle bars, forks) and accessories are personally customised for comfort and efficiency of use.

BikeBizz strives to treat their staff, suppliers and partners fairly and cooperate to build a profitable and sustainable value chain.

Value chain vision

Feedback
ST.9
Define the strategic goals
## LEARNING CASE STUDY OF TOWS

### STRENGTHS
- Skilled, loyal workforce
- Location close to neighbouring region
- Retail shop linked to the production site
- Production diversification possibilities: production of multi-purpose bikes

### WEAKNESSES
- Significant amount of waste/emissions
  - Scrap metal
  - Over spray sludge (including lead in paint)
  - Solvent emissions
- Lack of production manager
- Gender inequality
- No systematic production line
- High retail price

### OPPORTUNITIES
- Customers demand high quality more affordable, and sustainable products
- Good relationship with customers
- Demand for improved customer services (repair, maintenance, warranty)
- Low impact on environment
- Multi-functionality of bikes

### STRENGTHS-OPPORTUNITIES strategy ideas
- Use the fact of the retail shop being linked to the production site to offer improved customer services (repair, maintenance, warranty)
- Use the proximity of the shop to the production site for take back actions for end-of-life bikes to enhance recycling
- Use the proximity for behind-the-scenes tours to show customers parts of the production

### WEAKNESSES-OPPORTUNITIES strategy ideas
- Use the high demand for repair, maintenance for enhancing the life of a bike to reduce waste
- Find a production manager to build up a life cycle management plan to allow for analysis of the production line and possibilities to optimize production

### THREATS
- Raw material price volatility
- Waste generation along the bicycle life cycle
- Competitive market (local and international)
- Low retail prices
- No waste management system (end-of-life bicycles)
- High costs of high quality parts

### STRENGTHS-THREATS strategy ideas
- Being close to the neighbourhood can help building trust and understanding for higher prices
- Use that as a selling point because people will appreciate their high quality products more and generate less waste
- Diversify your production into multipurpose bikes as this will reduce the amount of metal used for other production lines
- Build up a waste management system using the help of the neighbourhood: loyal workforce can educate children how to repair bikes and maintain them for as long as possible

### WEAKNESSES-THREATS strategy ideas
- Hire a production manager to build up a waste management system
- Educate workers knowing the complete production process in order to describe a systematic production line to be able to face specific weaknesses
The SWOT analysis and TOWS template were used to generate a new business strategy that takes advantage of BikeBizz Co.'s current operational strengths (e.g. well established business operations and partnership relationships, skilled and loyal workforce and production diversification possibilities) and responds to identified market threats and opportunities. Particularly relevant threats identified include waste generation along the bicycle life cycle, competitive market (local and international), raw material price volatility and low retail prices. External opportunities such as customers demand for high quality products with low impact on environment and increased demand for improved customer services also create new possibilities, which BikeBizz Co. needs to consider when setting the strategic goals.

### STRATEGIC GOAL #1

| What hotspot or other SWOT issue does the goal help to address? | Waste generation along the bicycle life cycle |
| What is the desired change? | Reduction of metal waste along the bicycle life cycle by 75% |
| How will you know if the goal has been achieved? | Dumping rates will be reduced  
Output figures  
Input-output analysis |
| When will the change be achieved? | Within 5 years |
| Final formulation of the goal: | Reduction of metal waste along the bicycle life cycle by 75% within 5 years in cooperation with the value chain partners |

### STRATEGIC GOAL #2

| What hotspot or other SWOT issue does the goal help to address? | Customers demand high quality, affordable and sustainably produced bicycles |
| What is the desired change? | Track sales revenue for each financial year. Goal achieved when annual sales exceed are 25% higher than today. |
| How will you know if the goal has been achieved? | Certificates for lead free manufacture  
Suppliers proof by register of input substances  
Free of lead  
Testing of finished products for lead |
| When will the change be achieved? | Within three years |
| Final formulation of the goal: | Increase product sales revenue by 25% within 3 years |
## STRATEGIC GOAL #3

<table>
<thead>
<tr>
<th>What hotspot or other SWOT issue does the goal help to address?</th>
<th>Health problems associated with lead in paint</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the desired change?</td>
<td>Eliminate lead containing paints in cooperation with the value chain partners</td>

Examples of sustainability strategies in the metals sector

There are many different types of strategies used by companies in the metals industry that can lead to eco-innovation in the metals value chain, here are some examples:

• **Provide products and services to ‘green’ end markets.**
  For example, ‘green buildings’ is an end market that is currently growing and requires innovation across the value chain to improve the life cycle sustainability performance of buildings, especially in the building’s use phase. Eco-innovation potential exists for metals sector firms that can improve sustainability performance by e.g. providing sustainable infrastructure products for the construction phase, or by reducing energy consumption over the building’s lifetime by providing energy efficient machinery and equipment solutions (e.g. HVAC and automation systems).

• **Improve sustainability performance of direct customers and their clients.**
  Resource efficiency is an important driver for many businesses in all sectors to reduce material and energy costs, reduce GHG emissions, and demonstrate their commitment to sustainability to customers and shareholders. The metals sector can provide many different solutions to improve resource efficiency in various industrial applications such as HVAC, materials handling, packaging, textile processing, paper & print, machine tools, construction, etc. However, this strategy involves knowing the market trends of the industrial users and their clients.

  The automotive sector is an important example of how the metals sector can improve its sustainability performance towards the end market. The metals sector can contribute to improving the recyclability and fuel efficiency of vehicles by collaborating with the OEM in the automotive sector with strategies to reduce vehicle weight through reducing thickness, material density, or surface. Such technical innovations could involve strategies to develop new high strength steels, aluminium alloys or composite material.

  For example, the machinery & equipment manufacturing sub-sector can target industrial sectors with high energy consumption and offer products and services to reduce energy consumption, save operational expenses, increase renewable energy usage, and decrease GHG emissions.

  Another example of a strategy for improving the sustainability performance of customers is to prioritize aftersales services in addition to the initial product sale. For example, in the machinery and equipment subsector, such services could include optimisation support to minimise energy consumption and reduce operational costs for the customer. This strategy has the added benefits of strengthening customer relationships and provides an additional revenue stream.

• **Partnerships with strategic actors across the value chain offer new sustainable solutions.**
  Companies in the metal value chain are building platforms for successful networking and cooperation. Breaking down market access barriers, establishing supply and value chain long-term partnerships, cutting down maintenance costs, sharing R&D investment efforts are among others topics in the focus of the innovative networking activities.

  Partnering with other subsectors or actors in the value chain and offering bundled product/service-systems (PSS) is a strategy that can offer a competitive advantage. For example, the high quality...
cleaning of high precision metal parts is a common process in many high value industries (e.g. aerospace, medical, etc.) that is both energy intensive and can consume high amounts of expensive solvents. Metals sector equipment suppliers have cooperated with chemical companies to offer advanced cleaning services.

Other examples include bundling equipment and technology services across different value chains. For example, metals sector companies selling material recovery technologies (e.g. pigging technologies for liquids in chemical, beverage, and pharmaceutical industry) partner with metals sector equipment suppliers (e.g. energy efficient pumping technologies) to cover new, bundled products with added-value sustainability performance — in this case a pumping/material product-service system leading to improved energy efficiency and improved material efficiency.

- **Apply ‘Blue Ocean’ strategies**
  A strategy equally applicable to the metals industry is the ‘Blue Ocean’ strategy described in the Eco-innovation Manual. The following example is from within the metals industry, where a specific regulatory and market situation inspired a company to develop a technology to improve the End-of-Life (EoL) product management of batteries.

**Industry Example 2: Blue Ocean Strategy**

Akkuser, Finland, a company specialized in recycling of hazardous End-of-Life consumer batteries, was driven by an opportunity of turning an environmental need into a business case when they set their strategic goals:

- Provide solutions to upcoming regulatory pressures (EU, Finland, worldwide)
- Be a pioneer in development of a technology that ensures high recycling rate with low impact to the environment.

With the entire EoL value chain in consideration, Akkuser introduced innovations across several dimensions of their business: product development, process innovation and value chain cooperation. They invested in development of innovative products – recycling processes for hazardous batteries and accumulators in partnership with the Finnish innovation funding agency. The product innovations helped the company to achieve substantial business benefits and growth with the added value of supporting efforts to raise the degree of material recovery from EoL batteries and accumulators, help preserving natural resources, and reduce waste generation across the value chain. The company started applying BEPs to ensure safe handling of EoL consumer portable batteries and accumulators including WEEE-items during all stages of the recycling process. Further, they initiated cooperation with the EoL value chain and producer organisations to improve the product life cycle management specifically related to improving cost efficiency, sourcing strategies and dialogue between design, manufacturing and recycling.

**ECONOMIC BENEFITS:**

- Being ahead of competitors and regulation
- Within 5 years (2005-2010) company’s turnover has grown by almost 1000%
ST.9 Define the strategic goals

- Partnering with Tekes, the Finnish funding agency for technology and innovation facilitated R&D efforts to develop the alkaline technology
- Increased profitability across the EoL batteries and accumulators value chain

ENVIRONMENTAL AND SOCIAL BENEFITS:

- Dry-Technology®
  - Material recovery rate of above 90% - metals are recovered and other parts like plastic and cardboard are utilized in energy production
  - Reduced energy consumption compared with conventional recycling technique (nearly 90% less)
  - 100% elimination of waste water
  - Minimizing amount of solid waste
  - No CO2 emissions
- Method for chemical processing of alkaline batteries
- Energy consumption reduction is taking place at room temperature
- Enable the recycling and reuse of approx. 100% of its material
- Channels for communicating the green aspect to the customers: ISO 14001 and ISO 9001
- Developed partnership relationships across the value chain
- Investments in raising awareness about issues related to EoL batteries

<td>Description</td>
</tr>
</tbody>
</table>
| **Economic** | Access to new markets:  
- Domestic business-to-customer bicycles retail market segments worth US$ 600,000 – 1,300,000 that have shown a strong interest in sustainably produced personalised bicycles  
- Export business-to-business bicycle wholesale market segments worth more than US$ 1,000,000 that have shown a strong interest in sustainably produced standardised bicycles | Fitting with the goal to increase profit margins by 10% on both domestic and export sales by lowering production costs through waste reduction and higher efficiency in the production process. |
| **Environmental** | Addresses the key sustainability issue of high amounts of metal waste and hazardous substances along the life cycle | Aligned with the goal of reducing metal scrap waste to less than 1% of the input during production. |
| **Social** | Diversification (e.g. production of customized and/or multi-purpose bikes, introducing a return & reuse scheme) to reach new market segments | It contributes to the goal of becoming the local leader in sustainable production of personalised bicycles fitting local needs |
SET BUSINESS MODEL

Defining a new business model to deliver the business strategy
BM.3
Gather additional data on operational performance
SELECT A FLAGSHIP PRODUCT FOR PERFORMING AN LCA
When you decide to perform an LCA to understand in more detail the sustainability impacts of a company’s products, then make sure to select one of the company’s flagship product since metals sector companies typically offer multiple products and product lines. This helps to maximise the cost-to-benefit of performing the LCA. The results can often be applied to other product lines as well. Furthermore, a LCA of a “flagship” product will serve as a platform for communicating the company’s sustainability approach to stakeholders.

BM.4 Generate business model concepts at the big picture level

LEARNING CASE STUDY OF BUSINESS MODEL CANVAS

The strategic goals for BikeBizz Co. set in ST.3 and ST.9 are built upon the SWOT analysis and aim at overcoming sustainability hotspots. All strategic goals are transferred into the Business Strategy template and form the overall business strategy (ST.14). In order to implement the business strategy, it is necessary to formulate appropriate business models that are aligned with goals, markets, products and selling points specified in the business strategy. The business models implicate ideas, approaches and guidance on how to achieve the strategic goals. Below, three business model options for the BikeBizz Co. are described.

Business Model Option 1: “Return & Reuse”

Driven by the strategic goals on reducing metal waste across the product lifecycle, increasing revenue, and improving profit margin, the “Return & Reuse” business model idea was inspired by the ideas from the TOWS matrix to ‘use the proximity of the shop to the production site for take back actions for end-of-life bikes to enhance recycling’, and ‘use the high demand for repair, maintenance for enhancing the life of a bike to reduce waste’. With this business model, customers bring bikes at end-of-life to BikeBizz Co. where they are either adapted and resold or dismantled for reuse of the single parts. This scheme also comprises a discount scheme, which means that the customer can buy a new bike for a lower price when she brings back her old one. The company starts offering customer services like repair and maintenance to cater for the customer’s demand for this type of service and gains additional revenue.

The new sustainable “Return & Reuse” business model is captured in the following panel (Table 15) using the business model canvas.
BM.4 Generate business model concepts at the big picture level

</tbody>
</table>
### BM.4 Generate business model concepts at the big picture level

**Business Model Option 2: “Bike Leasing”**

The “Bike Leasing” business model is built upon the strategic goals on increasing revenue and improving profit margin, which can lead to higher financial capital for investment through regular leasing rates and higher total prices. In addition, the model alternatively addresses the demand of customers for more sustainable products and to reducing waste generation and transport emissions. In the case of the BikeBizz Co., a way of implementing eco-innovation could involve developing a new business model option in which the company would cooperate with the public sector through their green public procurement program. The company could offer a bike-leasing scheme to supply sustainably produced bicycles to authorities when equipping their fleet.

**Business Model Option 3: “Design for Sustainability”**

Driven by the strategic goals on reducing waste generation along the product life cycle, increasing revenue and becoming a leader on sustainable products, the “Design for Sustainability” business model was inspired by the ideas from the TOWS matrix ‘use the proximity to the retail shop for improved customer services (repair, maintenance and warranty)’ and ‘use the high demand for repair and maintenance for enhancing the life time of a bicycle to reduce waste’. An extension of the lifetime of the product can be achieved by applying the Design for Sustainability principles. In this business model option, the BikeBizz Co. would need to focus on implementing the principles into the design process steps and apply them further down the production process including the management aspects, e.g. the procurement of appropriate materials and components.
Based on the Value Management results from the first project, a scheme for the take-back system was devised and is illustrated below. There are two sources of raw materials used in the “Return & Reuse” scheme:

- Bikes that were not manufactured by BikeBizz Co. (competitors’ bike)
- Bikes that were manufactured by BikeBizz Co.

Regardless of the source of the bike, the parts and components’ suitability for reuse are assessed according to standardised tests. Bikes manufactured from BikeBizz Co. are designed for durability, reuse, and ease of repair. The yield of reusable/repairable parts is expected to be 95%. Bike components unable to be reused or repaired are sent to a local recycler so that BikeBizz Co can receive recycled metal materials in return, thereby closing the loop of its local business.

Some types of business models that can be found in the metals sector are:

**Service business models** – These allow extensive bundling of services with products, such as maintenance support and extended warranty, aftersales, customer training, product utility services, etc., that have the potential to bring different benefits for the company including significant impact on overall profitability of the company, strengthening value chain relationships and lowering the environmental impacts (e.g. reducing waste generation by extending life time of products).

Roland Berger carried out an extensive study on evolution of services in engineering companies [Berger, 2014]. Based on the results of the study they identified four types of business models which can be employed with regard to aftersales services for different strategies explained in section ST.1 Plan my data gathering strategy:

- **Technology leaders** benefit in aftersales, too, from their niche products’, patented elements and proprietary customer access. But aftersales has to secure technology leadership throughout the product life cycle.
- **Price leaders**, by contrast, face tough competition as products are less customer-specific and offer neither patented elements nor proprietary customer access. Customer decisions are driven mainly by price – and services must reflect this.
- **Application leaders** are characterized by specific process expertise with a strong focus on building prototypes or customer-specific engineered products. In aftersales, they need experts in particular with detailed application and customer knowledge to regularly upgrade the machines.
• Efficiency leaders, like price leaders, do not manufacture any patented parts and therefore face tough competition. After sales revenue is mainly generated by billing hours of service personnel's time. To guarantee global aftersales coverage, an efficient service network and the right critical mass are essential.

Closed loop business models – The approach is that products are designed for ease of reuse, disassembly and remanufacturing, or recycling, with the understanding that it is the reuse of waste materials reclaimed for end-of-life products, rather than the extraction of resources, that is the foundation of economic growth. Traditionally, this has been applied to high value metals such as gold and silver, however most metals are easily recyclable making the approach applicable to different metal supply chains. Moreover, the closed loop business model helps companies to become more sustainable by reducing the use and waste of resources, while diminishing possible regulatory burdens (e.g. deposit fees). In the Industry example 3, the Caterpillar case study illustrates how a company is profiting from applying a close loop business model.

Industry example 3: Remanufacturing – a sustainable solution
Caterpillar is the world’s leading manufacturer of construction and mining equipment, machinery and engines. Their business strategy is focused on ways to maximise the life cycle benefits of their products, while minimising the economic, social and environmental costs of ownership in close cooperation with stakeholders across the value chain of their products. Caterpillar’s remanufacturing programme, Reman, serves as a business model based on an exchange system whereby users return a used component (core) in return for remanufactured products. CAT remanufactured parts and components offer like-new performance, have a long, reliable service life and a same-as-new Cat parts warranty.

ECONOMIC BENEFITS
• Reman operations contribute to lowering 65% of the costs found in the actual parts and components and increasing profit margin, whilst still producing components of the highest quality
• CAT Reman activity is employing over 3600 people worldwide

ENVIRONMENTAL BENEFITS
• Remanufacturing dramatically lowers the volume flow of resources to more than 60,000 tonnes of end-of-life iron recycled annually and reduces landfill pollution to more than 85 million tonnes per year across the value chain
• 2.3M units (78M kg) are recovered contributing to keeping non-renewable resources (e.g. metals) in circulation for multiple lifetimes
• For example remanufacturing a cylinder head leads up to 61% fewer emissions of greenhouse gases and 86% reduction in energy used compared to making a new product

SOCIAL BENEFITS
• Customer services that go beyond selling, from financing to providing safety information and videos
• Demonstrating commitment to community stakeholders and the environment by taking the corporate social responsibility initiatives
• Innovative organizational systems that facilitate cooperation with the supply chain stakeholders – CAT Proprietary Core Management System
BM.4 Generate business model concepts at the big picture level

BACKGROUND INFORMATION

The “Leasing business model” – An approach, in which metals are leased for their use in the end-products or customers lease the end-products. These types of models often give manufacturers a reason to think about the product’s life cycle. A good example is the cooperation initiated by the Dutch consultancy Turntoo between the German precision engineering giant Bosch and Eigen Haard, the Amsterdam social housing provider. Their new leasing business model is based on the Value Proposition to offer washing services to the Eigen Haard tenants, who initially pay €10 per month for the service including water and energy consumption, while the washing machines are provided by Bosch, who retains ownership of the machines. In this business model Bosch provides energy saving and recyclable washing machines, cater for their functioning as well as maintain them to secure the machines life cycle. As a result, the company pays for energy and equipment costs and not the customer as in conventional business models.

BM.5
Generate ideas for the customer segments block
**TIPS & TRICKS**

**CONSIDER ENGAGING KEY PARTNERS**
You can consider inviting key partners from the value chain, including suppliers (materials, services, equipment) and customers to workshops in order to gain insights on which product functions and service offerings provide most value to customers. Furthermore, you can use such opportunities to quantify life cycle impacts downstream and upstream of the company. Incorporating suppliers in the workshop also raises awareness to the sustainability concerns of their end market and can provide incentive to collaborate on sustainable solutions. Companies often use Value Analysis/Value Engineering (VAVE), which identifies priority product functions, their relative cost, and overall value to the customer. VAVE activities have been known to reduce material costs by 30%.

**BACKGROUND INFORMATION**

The metals industry serves both “mass” markets (e.g. production of various metal and metal containing products) and “niche” markets (e.g. car batteries). In addition, an increasing number of companies in the metals value chain are moving towards offering tailor made solutions to specific Customer Segments, often including services. This migration helps to align the companies’ marketing and sales approach to the values of their customers, thereby improving their ability to provide customers with what they truly want and are willing to pay for.

Collaboration with suppliers and customers is becoming more common in the metals value chain, especially integrating customers into the cost and resource reduction process.
BM.6
Generate marketing ideas for the value proposition block
BM.6 Generate marketing ideas for the value proposition block

**TIPS & TRICKS**

**THINK OF SPECIFIC CUSTOMER NEEDS THAT YOUR PRODUCT SATISFIES**

Some innovations emerge when you consider the Value Proposition from a customer’s perspective. For example:

- Closing the material cycles by offering take-back schemes and re-mining and/or reusing metals and metal components from the returned products (e.g. CAT Reman business model described in BM.4) to alleviate the customer’s need to deal with the product at the end of its life and put back valuable material back in your operations.

- Leasing products or services for their use to customers instead of selling a physical product. and overall value to the

**PROVIDE ADDITIONAL TECHNICAL SERVICES TO YOUR CUSTOMERS TO ENHANCE THE VALUE PROPOSITION**

Providing technical services can enhance the Value Proposition for your customers and also address sustainability hotspots.

For example, maintenance services can improve the operating efficiency of machinery, which reduces energy consumption and increases customer satisfaction.

Other examples of technical services include:

- Aftersales services including remote monitoring and diagnosis of defects by using wireless transmission of data for installed equipment to the manufacturer.
- Industrial services for B2B engineered products industry including:
  - Maintenance for the reduction of metal scrap (including inspection, repairs and optimisation of production plants)
  - Technical cleaning of production facilities to reduce environmental impacts such as emissions to air and water
  - In-house logistics (handling and monitoring incoming goods, in-house supply of production factors, management of raw and recycled materials)

- Production support to optimise quality control (provision of appliances and personnel, building up the production organisation, quality control, finishing services such as galvanisation)
- Industrial assembly (disassembly, relocation and assembly of individual machines, parts of operation and entire production facilities without newly constructing plants).

**COMMUNICATE YOUR VALUE PROPOSITION THROUGH ECO-LABELS**

Eco-labels can add value to the end product by certifying that it meets specific sustainability criteria. For example, the Green Label Singapore Category 043 is a certificate that ensures that products are made from at least 50% mixed recycled materials including iron, copper, nickel and zinc.
BM.6 Generate marketing ideas for the value proposition block

LEARNING CASE STUDY OF PEOPLE, PLANET, PROFIT

**People**
- Bikes that are customised according to the customer’s body, riding style and needs
- Good customer service
- Extended life time of the product
- Elimination of hazardous substances
- Non-polluting processes

**Planet**
- Use of sustainably sourced, eco-friendly materials
- Reduction of hazardous and scrap metal waste
- Reduction of transport
- Reduction of emissions and pollution of the environment
- Collection, reuse & recycle of metal parts and components

**Profit**
- High retail price
- Low production costs
- New markets
- Reduced space required
- Positive corporate image
- High number of users
- Inhibit replication by competitors
- Economic price
- Return & reuse scheme
- Cheap & easy maintenance

**People**
- Customisation
- Optimal bike performance during the use phase
- Low waste production
- Collection, reuse & recycle of metal parts and components
- Extended life time of the product

TIPS & TRICKS

CONSIDER ECO-LABELS TO ENHANCE COMMUNICATION CHANNELS WITH YOUR CUSTOMERS

There are several opportunities that allow for the information of consumers about the sustainability performance of a particular product and support purchasing decisions. Some examples are:

• Eco-labels
• Industry standards
• Voluntary initiatives

For example, in Malaysia, the SIRIM QAS is an international eco-label often used as a marketing tool to enable a company to position its metal end-products as environmentally-friendly, which gives them a competitive advantage over other similar products in a consumer market that is increasingly becoming more environmentally conscious.

For instance, ECO 32 for coated flat steel products and ECO 38 for metal decking and panelling are some relevant labels in the metals sector. Another common way of communicating with customers is via an integrated customer relationship management (CRM) system and having dedicated key-account managers that maintain business-to-business (B2B) relationships.

BACKGROUND INFORMATION

Metals sector companies typically provide their products and services through a broad range of distribution channels: direct sales, e-commerce, customer service, aftersales, technical support, and third party distribution. However, many metals sector companies commonly include value-added technical services and sales support within their current Value Propositions. In fact, they offer them for free and even to companies that do not necessarily require these value-added services. This can be due to the presence of such actions in the business model, allowing the company to achieve their strategic goals. Industrial services play an increasingly important role in value-based corporate management and are a strategic success factors for machinery and equipment manufacturers, according to [Berger 2014].

BM.8 Generate ideas for the channels block

LEARNING CASE STUDY OF CHANNEL IDEAS

Marketing
- Communicate the sustainable aspects of the company, such as extended lifetime of the bicycle designed on the principles of the ‘Design for Sustainability’
- Engagement with local NGOs involved in promoting sustainable transportation
- Introducing sustainable procurement practices.

Sales

Delivery
BM.9
Generate ideas for the customer relationships block
Just-in-time Delivery (JIT) and lean manufacturing are production approaches prominent in the metals industry, particularly in the automotive sector. These approaches help the automotive industry to achieve various benefits including: productivity improvement, waste management, better production scheduling, increased emphasis on supplier relationships, synchronised and optimised production processes leading to increased resource efficiency (energy material), etc.

Another example specific to metals industry companies is using different customer services to strengthen the customer relationships and generate sales e.g. take-back schemes, rental and leasing services, repair and reuse programmes, industrial services, etc. As mentioned in BM.7, aftersales services offer possibilities to maintain customer relationships and bring benefits to both producers and customers. These services might include: analytical tools, performance-boosting programmes, advisory services, and remote diagnostics. These further offer great business potential and should be taken into consideration at the strategic level to leverage previously untapped profit potential.
BM.10
Generate ideas for the revenue streams block
The revenue stream(s) mainly depend on the value proposition and the customer segment. As seen in the Industry example 3 in BM.4, Caterpillar reports that their CAT Reman remanufacturing programme allowed them to dramatically reduce costs for raw materials and thus increase profits.

Aftersales business offers vast profitability potential:
- at least 30% in revenue for machinery and equipment engineering
- up to 65% in profits for engineered products

As stated in the Value Proposition block, such aftersales services can include spare part replacement, improvement of product performance, or consultancy – each with a different business model, level of customer relationship, and revenue stream.

References
BM.11
Generate ideas for the key resources block
The following is a list of key resources typical of the chemical industry to help you think about how to generate new eco-innovative business models:

- **Raw materials**: price, volatility, availability – importance of procurement principles
- **Customer Relationships**: marketing, sales, channel offerings.
- **Physical equipment**: move towards multi-functional and modular plants (e.g. F3 factory project). Furthermore, process intensification can lead to smaller, more compact and reliable plants reducing the ecological footprint of production.
- **Staff**: Marketing and Sales, R&D, EHS, procurement
- **IT-based CRM or customer interface (depending on business model)**

### TIPS & TRICKS

**CONSIDER SECONDARY MATERIAL USE**

The use of secondary raw materials is quite common in the metal value chain and serves as a response to diverse sustainability challenges the industry is facing, such as raw materials scarcity, price volatility, demand for more sustainable products, waste reduction, etc. It therefore entails a great potential for innovation. For the usage of secondary raw materials the *Life-cycle Stakeholder* template used in activity PR.3 can help to identify potential partners that could help to increase the availability and quality of secondary raw materials. For example, recyclers can provide new processes for recycling starting with the customer demand for sustainable products. These secondary raw materials can be gathered through take-back schemes, which reduce the amount of metal disposed of and increase the amount of scrap metal available as a secondary raw material.

**BACKGROUND INFORMATION**

The use of secondary raw materials is quite common in the metal value chain and serves as a response to diverse sustainability challenges the industry is facing, such as raw materials scarcity, price volatility, demand for more sustainable products, waste reduction, etc. It therefore entails a great potential for innovation. For the usage of secondary raw materials the *Life-cycle Stakeholder* template used in activity PR.3 can help to identify potential partners that could help to increase the availability and quality of secondary raw materials.

- Raw materials: price, volatility, availability – importance of procurement principles
- Customer Relationships: marketing, sales, channel offerings.
- Physical equipment: move towards multi-functional and modular plants (e.g. F3 factory project). Furthermore, process intensification can lead to smaller, more compact and reliable plants reducing the ecological footprint of production.
- Staff: Marketing and Sales, R&D, EHS, procurement
- IT-based CRM or customer interface (depending on business model)
**BM.11 Generate ideas for the key resources block**

**LEARNING CASE STUDY OF KEY RESOURCES IDEAS**

### SWOT
- Dependent on the supply of high quality, sustainably sourced metals and volatile prices.

### Additional data on the business model
- Can decouple from the volatile metals market

### Additional data on operational performance
- New skills in working with customers as well as new partnerships with metal waste collectors to capture the required quantity of end-of-life metals

### Key resources

#### Physical
- Physical resources such as fixed assets (property, plant, and equipment; e.g. machining equipment) or materials required to make the product (steel bars, aluminium parts, industrial cleaning agent)

#### Intellectual
- Brands, design or manufacturing know-how, customer knowledge, etc. (BikeBizz Co. brand name, expert system for customizing bikes to customer’s body type and riding style)

#### Financial
- Access to financial resources as listed in the Eco-innovation Manual (e.g. green credit line for switching to an environmentally friendly surface cleaning technology)

#### Human
- Employees who are particularly important to the success of the company (bike designers, marketing manager, buyer responsible for procuring sustainably sourced metal parts)
- New skills in remanufacturing end-of-life bikes and their components
Generate ideas for the key activities block
Typical key activities in the metals industry can be focal points for eco-innovation:

• R&D – particularly in designing for sustainability. 3D printing can be used to quickly and efficiently make prototypes and reduce resource consumption

• Production – sustainability performance can be substantially improved by using advanced manufacturing techniques such as 3D printing (e.g. parts from titanium powder), additive manufacturing, as well as integrated production techniques (industry 4.0)

• Customer Relationship Management (CRM) – channels, sales, and marketing are key activities for successful metals industry companies and are integrated with production.

• Spectrum of activities related to closing the loop models (return, reuse, remanufacturing, separation and recycling)

• Quality control – of raw materials, semi-finished inputs, and final products are critical in reducing off-spec products which lead to high life cycle economic and environmental costs

• Procurement – green procurement principles can be mainstreamed into purchasing forms

• Extended product responsibility – particularly critical for take-back systems, especially EEE products.

Industry example 4: Closed loop business model

The Kingfisher Group has developed a new, closed loop business model to deliver improved Value Propositions to their customers. The Value Propositions of the company are relevant, better, sustainable and affordable products and services for the customers. It also resulted in a healthy annual dividend for the shareholders and created additional employment for society. The key activities concerning this approach include responsible sourcing, design for reparability and recycling. Some examples from the Group would be the re-mining of materials from power tools containing metal parts, which is done by Screwfix UK, subsidiary of Kingfisher group. Another example is the rental and repair services offered by Castorama, another affiliate to the group. The idea originated due to many people owning these tools, however only used them rarely, resulting in resource inefficiency, hence the provision of a rental service. The company created partnerships with its suppliers who design durable products for rental which have a longer life span and are easier fixed by authorized professionals. The offering of these services also strengthens the customer relationship.

References
BM.13
Generate ideas for the key partnerships block
Typical key partnerships in the metals value chain are:

- Suppliers of raw materials (metals) and other products used in the production processes including chemicals (coatings, paints, lubricants, etc.). In example 1 (described in PR.5), Adelca illustrates how the company invested in building up its network of recyclers to ensure sufficient supply of scrap metals.
- Technology service providers such as equipment suppliers (core and supporting processes), IT data management, process optimisation experts, etc.
- Distributors and wholesalers
- Local and national governments can also be important partners in supporting eco-innovation activities by implementing policies to support sustainable practices in SMEs.

BACKGROUND INFORMATION

BM.13 Generate ideas for the key partnerships block
BM.14
Generate ideas for the cost structure block
Raw materials traditionally constitute the highest cost position in a metals sector company (typically 30% of total costs). Metals with volatile prices can have a significant negative impact on a company's profitability. Therefore, business models that minimize the amount of material used or have take-back / remanufacturing schemes not only offer potential for significant lifecycle savings but also reduce the variable operating costs of the company (see the Adelca and CAT Reman case studies in PR.5 and BM.4 respectively).

**LEARNING CASE STUDY OF BUSINESS MODEL CANVAS**

### Key Partners
- Suppliers of manufacturing equipment –
- Suppliers of steel and aluminium semi-finished products –
- Suppliers of process agents and paint pigments +
- Energy providers +
- Retail partner+
- Customers involved in return scheme –

### Key Activities
- Manufacturing of customised bike frame and rims including treatment steps: coating, painting and assembly of bicycles –
- Servicing during use phase: maintenance and repair –
- Take back activities: appraisal of returned bikes, repair of bike as a whole or disassembly and reuse of single components –
- Marketing, awareness creation & selling of products including export –
- Training employees on health and safety issues and providing personal protective equipment (PPE) –
- R&D activities -

### Key Resources
- Flexible manufacturing facilities & manufacturing equipment +
- Materials including recycled and reused material and parts –
- Non-polluting process fluids used for production: lead free paints, water based solvents –
- Skilled and dedicated staff (experienced in e.g. recycling possibilities, design or ergonomic issues) –
- Customer service department (e.g. technicians, service vans) –

### Value Propositions
- Return & Reuse scheme consisting including:
- Design and manufacturing of sustainable bicycles customised and accessorised according to the customer’s body type, riding style and needs
- Bicycle remanufacturing and maintenance
- Additional features include:
  - Different levels of customisation
  - Different levels of servicing and product warranty
  - Discount schemes for new bikes when donating other bikes at end-of-life.

### Customer Relationships
- Personal direct communication with customers and retail partners: face-to-face, telephone, internet +
- Customer service –
- Customer retention because of warranty service–

### Customer Segments
- Local customers
- Personal
- Companies
- Retailers/wholesalers/distributors
- Partner retail shop in the neighbouring region (export)

### Channels
- Sales force in own small bike shop +
- Marketing
- Customer services
- Associations (e.g. trade/tourism organization, NGOs)

### Cost Structure
- Economic costs (monetary – fixed, variable)
- Materials procurement
- Management costs: labour, administrative, marketing costs
- Equipment costs (including new equipment for process optimisation)

### Revenue Streams
- Sales of sustainably produced bikes – locally and export
- Sale of spare parts
- Revenue from repair and after sale services
- Revenue from scrap selling
- Higher profit margins due to reduced processing costs and offered services

Pitch the new business model to the CEO
Pitch the new business model to the CEO

LEARNING CASE STUDY OF BUSINESS MODEL PITCH

Business model name
Return&Reuse

Business model in a nutshell
Providing the repair and maintenance services as well as dismantling and reassembling the returned bikes.

Operations
- Promoting the return and reuse scheme in order to guarantee that the customers will participate
- Maintaining a good customer relationship, which is mostly done by direct communication.
- Recovering aluminium parts of the bicycle.
- Communicating the sustainable aspect of the company and promoting the customer services through the sales forces in the shop as well as the media used for marketing or different associations

Benefits
- Lower raw material consumption and reduction of waste along the bicycle life cycle, contributing directly to the realisation of the new strategic goals to produce sustainable bicycles and reduce of metal waste along the bicycle life cycle by 75% in 5 years in cooperation with the value chain partners
- Makes the customers key partners of the company
- Raw material saving also implies reduced energy consumption.

Costs
- Additional labour costs, but brings economic benefits both to the company, due to cost saving through reuse of parts, and the customer, who can turn their end-of-use bike into money, as well as environmental benefits because of the reduced raw material consumption and waste disposal

Effort
- Recovering bike parts and the skilled staff that perform the service activities
BM.19 Pitch the new business model to the CEO

Business model name
Bike Leasing

Business model in a nutshell
Bicycle life cycle service through the leasing scheme

Effort
• Being in line with the green procurement programmes

Operations

Benefits
• Contribute towards the requirement to reduce the waste generation along the bicycle life cycle through the leasing scheme.
• Reduce the emissions resulting from transport
• Reducing emissions and hazardous waste generation

Costs
•
**Business model name**

*Design for Sustainability*

**Business model in a nutshell**

*Producing bicycles with an extended life time*

---

**Benefits**

- Reduced resource consumption and waste generation
- Higher durability of the bicycle and thus safe money due to increased lifetime of the bicycle
- Higher retail prices that are justified by using high quality materials to produce longer lifetime products.

---

**Costs**

---

**Effort**

Switch to new business model
BR.3
Define and prioritise the requirements of the first project
**TIPS & TRICKS**

**START WITH LOW HANGING FRUITS TOWARDS OF AN AMBITIOUS PATH** 
Ideally the first project should not focus on incremental improvements within the company, but rather a kick-start to the eco-innovation process moving towards a sustainable business model. If possible, you can consider incorporating profitable quick-wins into the first project in order to demonstrate early success to team members and management. KPIs should be defined to measure and monitor the progress of the project and its sustainability impact.

---

**LEARNING CASE STUDY OF REQUIREMENTS SPECIFICATION**

**Value Management project 01**

The value management project engages value chain actors (suppliers and customers) and integrates them in the process of designing and manufacturing the new bicycle as well as the specific “Return&Reuse” business model elements such as types of services to be provided. In particular, workshops will be used to identify customer priorities with respect to primary and secondary functions and engage the value chain in providing sustainable solutions.

This project will also provide opportunities for BikeBizz to establish deeper links with the value chain with the possibility for training suppliers on green procurement principles and improving their own sustainability performance.
**BR.3 Define and prioritise the requirements of the first project**

REVIEW

Review the performance of the first project for eco-innovation and update your plans for the future.
RE.1
Do a project review workshop
RE.1 Do a project review workshop

TIPS & TRICKS

REVIEW THE ECO-INNOVATION KPIs
As part of the project review you should evaluate the KPI’s used for the project. This includes evaluating whether the set KPI’s are adequate according to what they should measure. Furthermore, it will be important to examine whether the input data is representative and meaningful, thus allowing appropriate tracking of the success. The UNIDO Cleaner Production Toolkit suggests a template for a short report on the KPI’s (UNIDO CP Toolkit volume 7), which can be used and adapted for this purpose. relationship with key clients.
Table 8 shows several indicators to measure sustainability in the Metals sector. The financial, business, environmental and social indicators constitute important KPIs for the Metals sector.

The KPI's defined for the Value Stream Mapping project should be revised at different points in time to ensure the direction of the project and to evaluate the progress. In the case of BikeBizz Co., the fulfilment of the requirements listed in Table 21 need to be reviewed along the process (see BR.3).

After the first project month, requirements 1 and 2 were evaluated. As a result, requirement 1 has been fulfilled: three training sessions have been conducted for selected staff involved in the value stream mapping. Regarding requirement 2, eleven KPI's have been set for being able to quantify the value streams. Among those were the Process Cycle Efficiency (PCE), the Overall Equipment Efficiency (OEE), the quantity of VOC emissions at the painting booth, the total amount of scrap produced during production. The business and production goals have been taken over from the business strategy.

After project month two, it was ascertained whether it had been possible to collect all the data required for having values for the KPI's. Different instruments had been acquired, like thermocouples for measuring the oven temperature, while some other measurements (paint sludge composition) had been assigned to external companies.

After obtaining all critical data from relevant departments, the PCE (value added time/total process time) was calculated to be 12%, which is well below the industry best practice lean manufacturing standard of 25%. Analysis of the turnover time for each process revealed that the process for cutting off the tube-ends for assembly required two workers when one could suffice with minor capital investment.

Additional identified processes with a low cycle efficiency was the surface cleaning and painting step where significant resources are spent on equipment cleaning (for colour changes) as well as management of hazardous waste. It was estimated that the PCE could be increased by 5% just by improving existing practices and with minor capital investment.

The KPI's were deemed fit-for-purpose after cross-referencing them alternative methods of calculation, e.g. using purchasing and sales records.

Review the business model and roadmap
**RE.3 Review the business model and roadmap**

**LEARNING CASE STUDY OF BUSINESS MODEL & ROADMAP REVIEW**

<table>
<thead>
<tr>
<th>Results from project review</th>
<th>Validity of roadmap</th>
<th>Validity of business model</th>
</tr>
</thead>
<tbody>
<tr>
<td>• In the course of transition to the new business model, the BikeBizz Co. faced considerable changes regarding different company aspects.</td>
<td>• Channels do not undergo significant change, while the customer relationship is strengthened through the establishment of the services and the return schemes.</td>
<td></td>
</tr>
<tr>
<td>• The new Value Proposition includes the aspect of sustainable sourcing and producing bicycles, as well as the whole service section (“Return&amp;Reuse” model and maintenance services).</td>
<td>• On a positive note, revenue is increased via additional earnings from the service provisions and monetary savings due to increased resource efficiency.</td>
<td></td>
</tr>
</tbody>
</table>

**Validity of roadmap**

**Progress on sustainability hotspots**

• Progress on the procurement of sustainably sourced material including different metals (e.g. steel and aluminium) and non-hazardous chemicals (e.g. lead free paints, water based lubricants), using sustainable production methods; and offering a range of new services (e.g. maintenance, “Return&Reuse”, microfinancing).

**Performance gaps**

• New costs also arise, such as newly employed staff for the “Return&Reuse” work, or the costs related to the changes for making the production process more sustainable.

**Next project for the company**

**Roadmap order**

**New ideas to roadmap**

• Economic benefits to the company and society, as well as shorter production lead times.
Glossary of key terms

**Business model**
Describes how a company does business. It is the translation of strategic issues, such as strategic positioning and strategic goals into a conceptual model that explicitly states how the business functions. The business model serves as a building plan that allows designing and realizing the business structure and systems that constitute the company’s operational and physical form. (Osterwalder et al, 2005).

**Business strategy**
Describes the long term goals of the company and the markets in which the company will operate (i.e. vision and mission) (adapted from Andrews, 1997).

**Gender**
Describes the roles, behaviours, activities, and attributes that a given society at a given time considers appropriate for men and women. These attributes, opportunities and relationships are socially constructed and are learned through socialization processes. They are context/time-specific and changeable. (UN Women)

**Gender discrimination**
Describes any distinction, exclusion or restriction made on the basis of sex which has the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise by women, irrespective of their marital status, on the basis of equality of men and women, of human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field (Art.1 CEDAW, 1979).

**Gender equality**
Refers to the equal rights, responsibilities and opportunities of women and men and girls and boys. Equality does not mean that women and men will become the same but that women’s and men’s rights, responsibilities and opportunities will not depend on whether they are born male or female. Gender equality implies that the interests, needs and priorities of both women and men are taken into consideration, recognizing the diversity of different groups of women and men. Gender equality is not a women’s issue but should concern and fully engage men as well as women. (UN Women)

**Gender-sensitive**
Rescribes an attempt to redress existing gender inequalities when designing and implement development projects, programs or policies.

**Life cycle**
Consecutive and interlinked stages of a product (good or service), from the extraction of natural resources to the final disposal (adapted from ISO 14040:2006).

**Life cycle assessment**
It is a systematic set of procedures for compiling and examining the inputs and outputs of materials and energy and the associated environmental impacts directly attributable to the functioning of a product throughout its life cycle (adapted from ISO 14040:2006).

**Life cycle thinking**
It is a mostly qualitative approach to understand how our choices influence what happens at each of the stages of the life cycle of an industrial activity: from raw material acquisition through manufacture, distribution, product use and disposal. This approach is needed in order for us to balance trade-offs and positively impact the economy, the environment, and society (UN Environment, 2004).
Glossary of key terms

**Marketing**
It is the set of activities that are designed to help the company to understand the type of product it should offer to a market and communicate the benefits and value of the product to the targeted consumer. Marketing focuses on the product, promotion, price and distribution channels.

**Market analysis**
It is the activity of gathering information about the size, growth, profitability, target groups and existing products of a market, which is used to inform decision making at a strategic level. This specific activity would fall under the broader umbrella of marketing activities.

**Organization structure**
It refers to the range of activities and key resources (human and financial) within the company, in addition to those relating directly to production, that are dedicated to supporting the business model. These include procurement processes, distribution, key partnerships, customer relationships and interfaces, research and development, internal communication, and revenue generation.

**Partners**
It refers to parties in the value chain that provide or receive value including suppliers, outsourced workers, contractors, customers, consumers, clients, members, and others (ISO 26000:2010).

**Roadmap**
It is a planning tool used to support the implementation of strategies. It is made up of a series of projects that will help to progress the organization from the company’s current position towards fulfilling the organization’s goals (adapted from Phaal R et al, 2007).

**Stakeholder**
It is any group or individual who can affect, or is affected by, an organization or its activities. Also, any individual or group that can help define value propositions for the organization (Stakeholder Research Associates Canada Inc., United Nations Environment Programme, AccountAbility: Stakeholder Engagement, 2005).

**The supply chain**
It is a system of organizations, technology, activities, information and resources involved in moving a product or service from supplier to customer (Michael Porter 1985) are the most significant impacts in the value chain or the life cycle of a product or service system, which can be used to identify impact improvement opportunities and to prioritize impact reduction actions (UN Environment/SETAC, 2014).

**Value**
It is understood to involve creating economic value (the revenue that a firm gets in return for its goods or services) in a way that also creates positive Outputs for society by addressing its needs and threats, taking into account economic, environmental and social considerations (adapted from Porter & Kramer, 2011).

**A value chain**
It is the entire sequence of activities or parties that provide or receive value in the form of products or services (e.g. suppliers, outsource workers, contractors, investors, R&D, customers, consumers, members) (ISO 14001 CD2, 2013). See also Partners definition above.

**Value proposition**
It refers to the products or services that an organization offers to a specific market segment that the organization believes will create value for that specific market segment.
