

An **important argument** in favour of environmental policy integration is the **economic and social co-benefits** that can be expected from **implementing environmental policies**

There has been **innovation in environmental policies** and instruments to **reduce emissions and resource depletion**

Coalitions between government institutions, businesses and civil society can **achieve progress**

Successful models of **environmental governance** should be built upon well-designed policies and their **implementation, compliance and enforcement**

Innovations are **part of the solution** but can **also create new risks** and have negative environmental impacts

Existing policies have proven **insufficient** to address the backlog of environmental problems

Achieving internationally agreed environmental goals on pollution control, clean-up and efficiency improvements is crucial, yet insufficient to achieve the SDGs

Current environmental policy alone is not enough to address these challenges, but **need to be incorporated in non-environmental policy sectors** too
