Livestock production uses 77% of agricultural land for feed production.

By 2050, land degradation and climate change will have forced 500-700 million people to migrate.

Sustainable land management is a major instrument for climate change mitigation because it improves carbon sequestration in the soil.

Reducing food losses and waste will have environmental, social and economic benefits.

Policies empowering women, indigenous people, family farmers and pastoralists can reduce environmental impact, increase agricultural productivity and contribute to reducing poverty and hunger.

Women represent 43% of those active in agriculture, yet they have rights over less than 20% of agricultural land.

Approximately 33% of food produced globally for human consumption is lost or wasted.

By 2050, the world needs to produce 50% more food to feed the projected global population of 10 billion people.

Food production uses 50% of habitable land.

29% of global land is affected by land degradation, impacting the 3.2 billion people living there.
