Data-driven policies

GUYANA

Guyana's landscape features tropical forests, mountain ranges, savannahs, wetlands, and incredible waterways

Guyana is located on the Northern Coast of South America, sharing borders with Brazil, Suriname, and Venezuela.

Mining is a main economic activity in Guyana, however, Guyana's economy is extremely diverse including oil and gas production, agriculture, logging, manufacturing, tourism, etc.

GUYANA

85% of Guyana's land territory (215, 000 km²) is forested

Guyana has maintained the second-highest percentage of forest cover on earth with more than **99%** of the country's forests remaining

Guyana's deforestation rates are among the lowest in the world (considered a High Forest Low Deforestation (HFLD) state. Guyana's deforestation rate has remained below **1%** since 2012

Mining in Guyana

- Guyana has a long history and tradition of mining at the small, medium, and large scales
- Gold mining, particularly, has been a major GDP contributor to Guyana's economy (8.3% of the non-oil GDP in 2022)
- Despite mining extraction over the years, Guyana has maintained low levels of deforestation

- Mining in Guyana is regulated by the Guyana Geology and mines commission (GGMC)
- The GGMC records data on the concession boundaries and the locations of mineral dredges
- Regular inspections are also undertaken and this information is then spatially linked to the dredges and the concession boundaries datasets

- The use of geospatial data plays a key role in measuring the extent and impact of mining in Guyana
- Geospatial data also plays a key role in monitoring mining activities in Guyana by combining datasets from a number of sources
- Data generated from Guyana's MRVS are used to measure deforestation and degradation from mining in Guyana

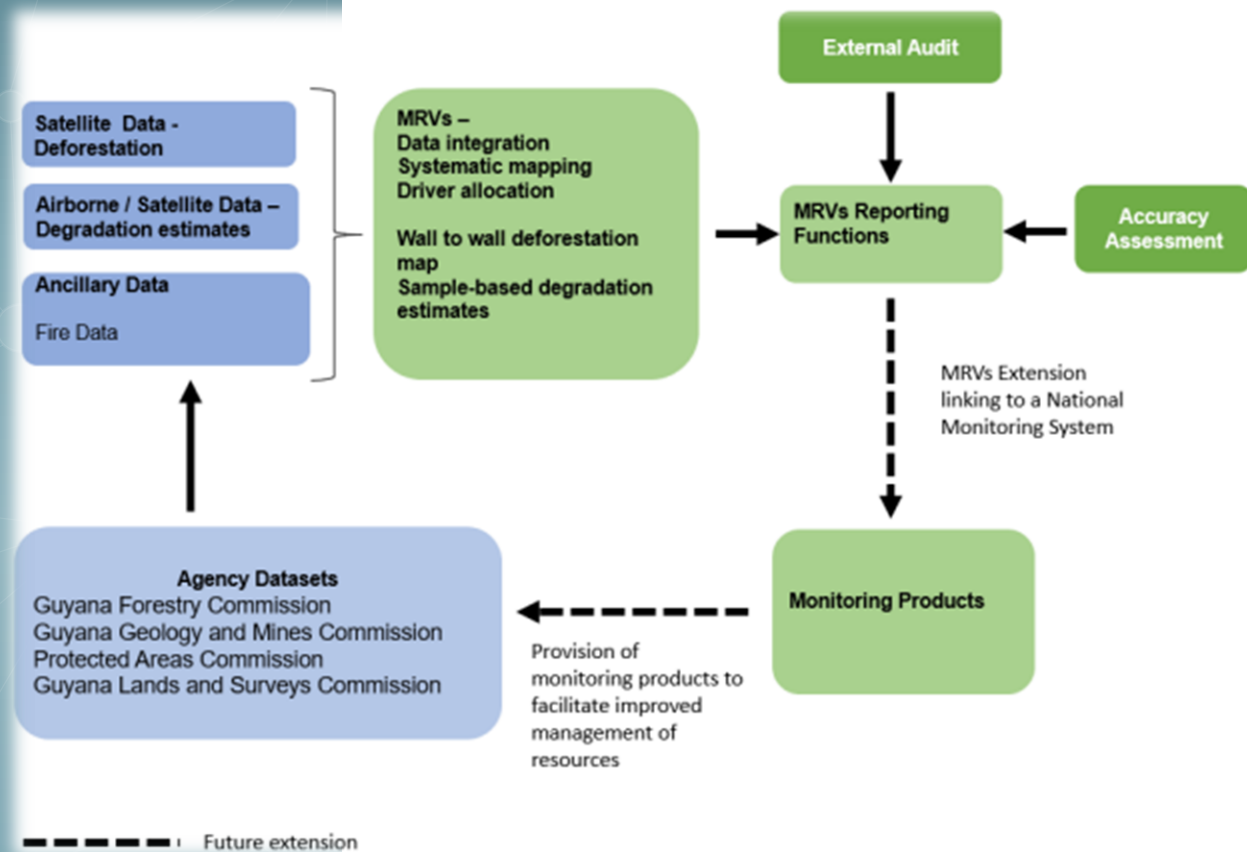

Guyana's MRVS

Guyana's Monitoring Reporting and Verification System (MRVS) is a national system developed to monitor, report and verify forest carbon emissions resulting from deforestation and degradation

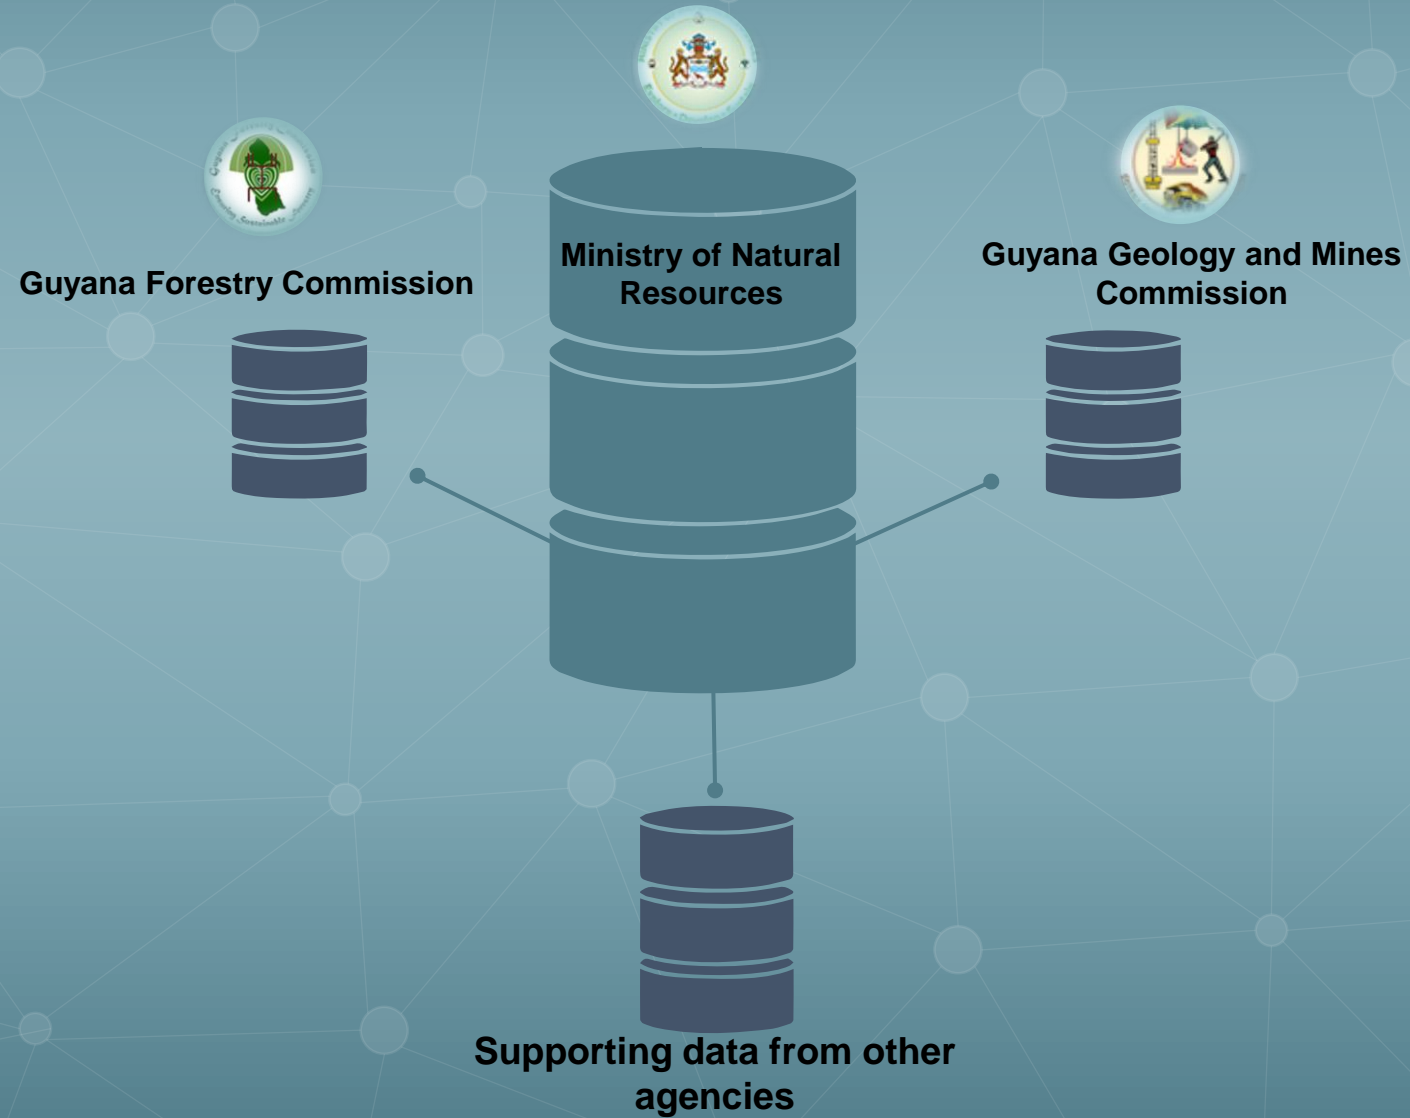

Through this robust system, Guyana has been able to track and quantify forest change and identify the associated drivers of this change for over a decade

In 2009, Guyana developed a framework for the MRVS and deforestation and degradation mapping commenced in 2010

The data generated from this national MRVS, is used across a number of sectors in Guyana to guide decision-making, natural resource, and environmental monitoring and policies

Geospatial data integration

Integrating web-based solutions

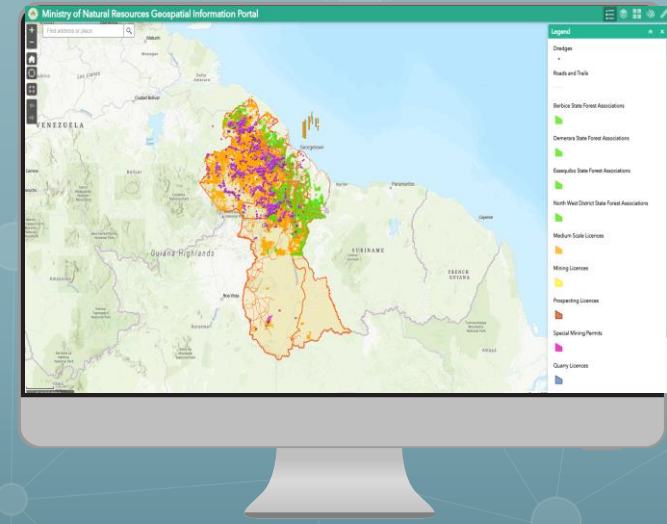

The Ministry of Natural Resources and the Guyana Geology and Mines Commission have been able to optimize geospatial data by integrating web-based solutions to improve the monitoring of mining activities.

Dashboards
Dashboards configured using ArcGIS Online tools allow easy visualizations of statistical reports of mining operations

Web map applications
Web-map applications configured using ArcGIS Online tools allow visualization of multiple data layers to guide decision making

The use of web-based solutions via ArcGIS Online is a result of partnerships with USGS and a company called Cadasta.

Web map application

01

The application is accessible via the internet and requires log-in credentials that are available to key decision-makers and staff.

02

The application integrates datasets from a number of sources in one place that provides a comprehensive and spatial view of the activities in the natural resources sector

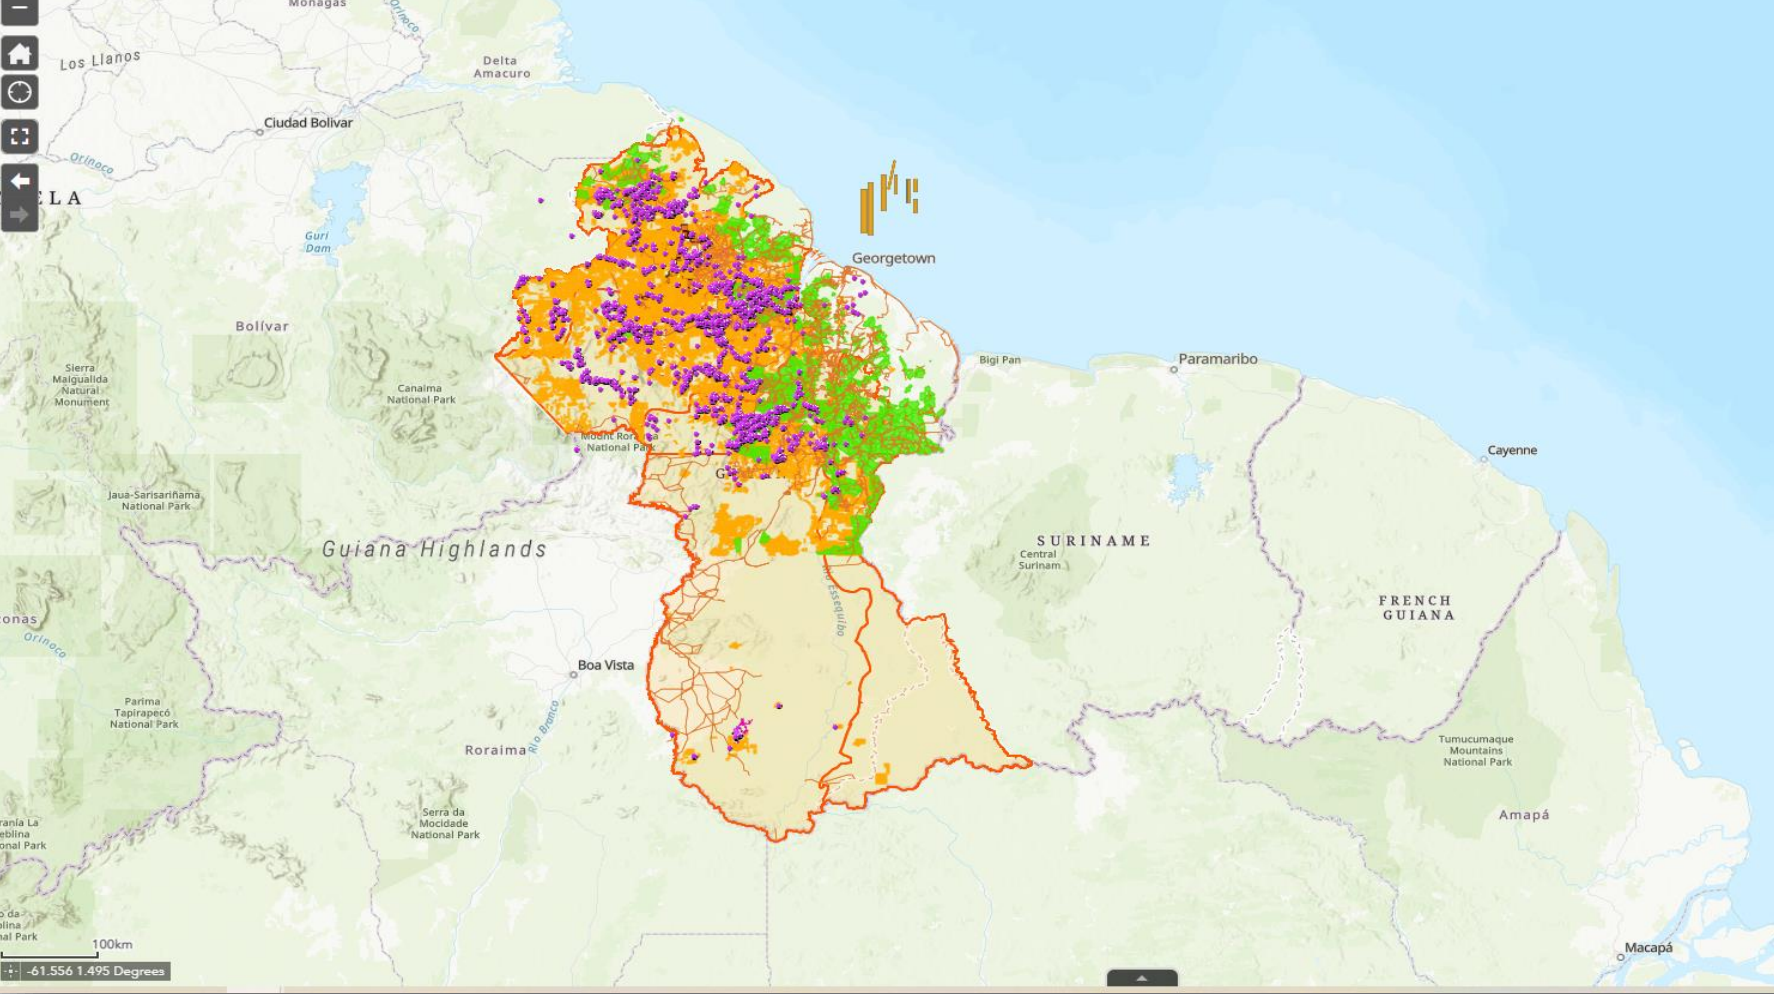

03

The application is interactive and allows further investigation of the datasets inclusive of viewing statistical attributes.

04

The datasets in the application are updated whenever there are updates from the agencies generating the data

Dashboards

01

Dashboards are also accessible via the internet and require log-in credentials

02

The dashboards provide a visualization of multiple screens at once that work together to provide valuable information to the user

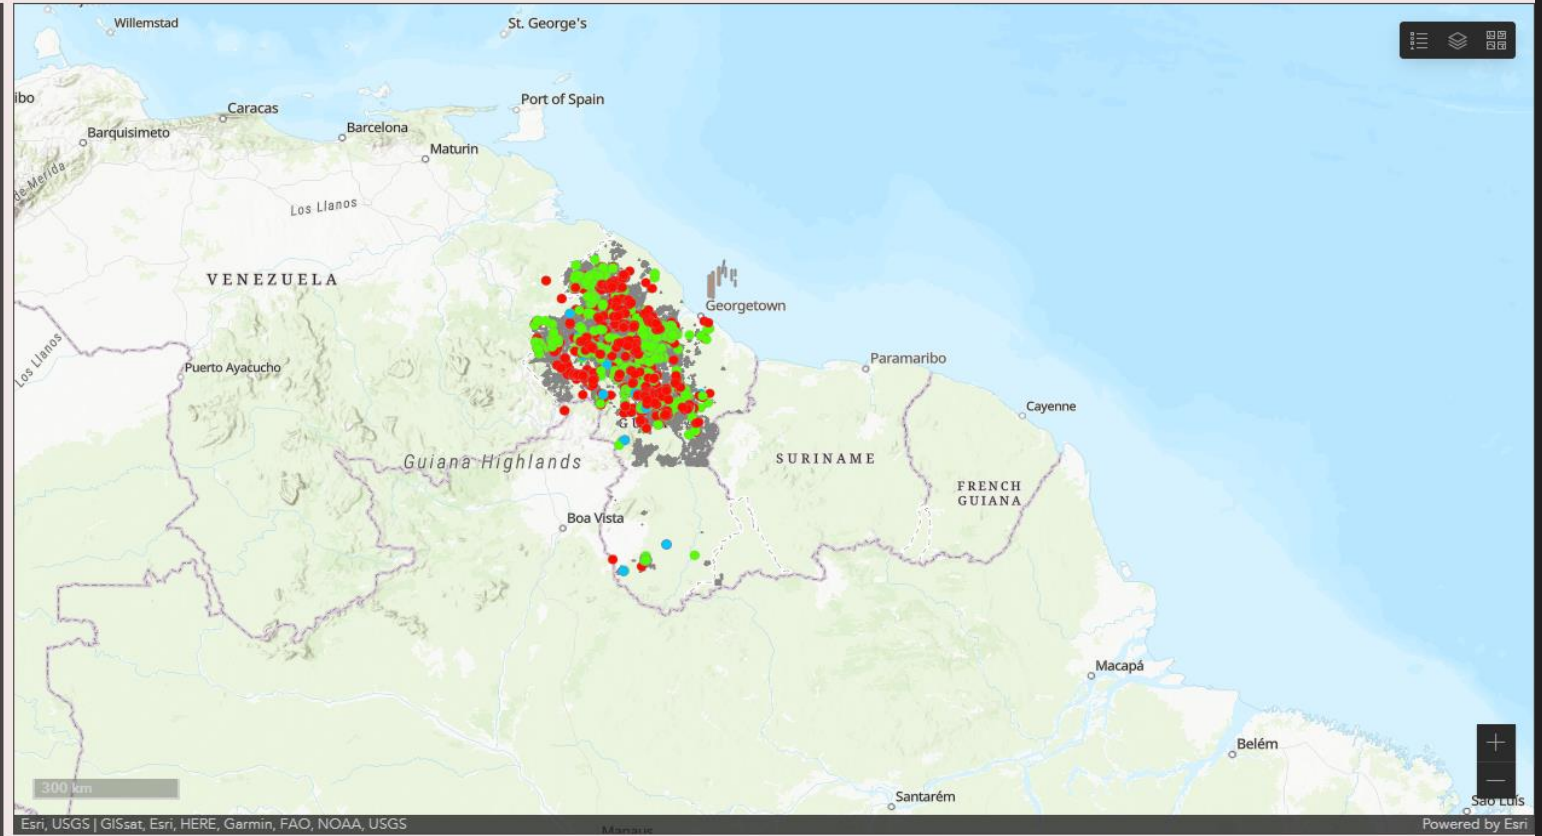

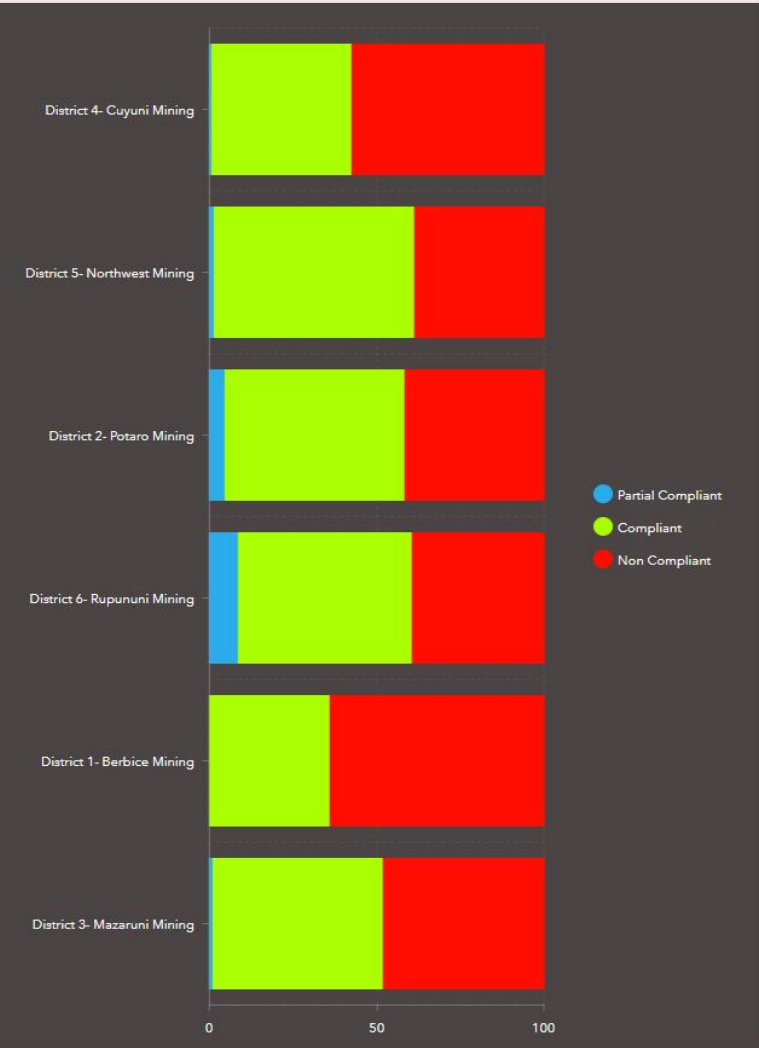

03

The visualizations are based on the quality of the datasets and the type of information that is available in a spatial format

04

Like the web map applications, the dashboards are updated whenever there are updates from the agencies generating the data

Data-driven policies- Guyana's LCDS 2030

Building on the work started in 2009, Guyana launched its expanded Low Carbon Development Strategy 2030 - a framework to map the path of a new growth trajectory in a non-polluting way

The national strategy outlines a number of policy directions to ensure continued extractive activities while protecting the environment. This includes measures to maintain low deforestation, improve mining practices, and gain payments for forest conservation

These measures outlined in the LCDS 2030 are driven by data generated by the robust national MRVS

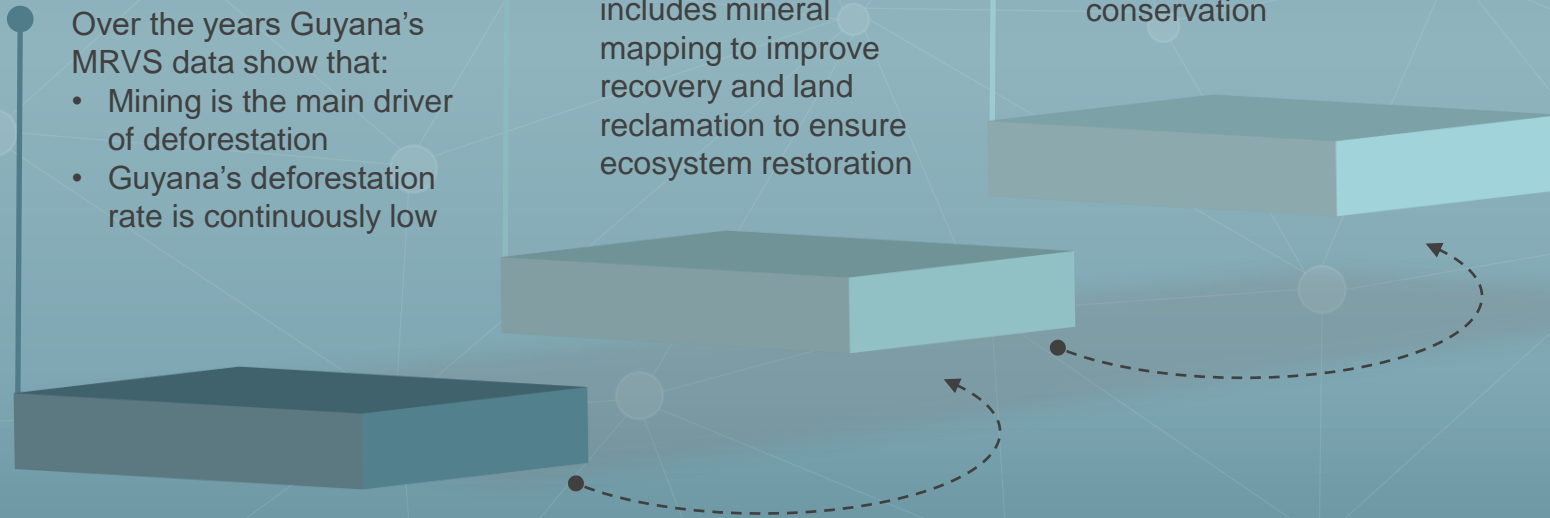

Data-driven policies- Guyana's LCDS 2030

Over the years Guyana's MRVS data show that:

- Mining is the main driver of deforestation
- Guyana's deforestation rate is continuously low

- This data is used to inform policies to ensure low-impact mining. This includes mineral mapping to improve recovery and land reclamation to ensure ecosystem restoration

- Further, with consistently low deforestation rates and the data to support this, Guyana has leveraged its HFLD status to gain payments for forest conservation

THANK YOU
