Geospatial and Other Data Sources for Environment Statistics: Assessing the Impact of the Economy on the Environment; 21-23 March 2023

## Marine monitoring needs and challenges in a country example: Uruguay

Virginia Fernández Ramos, PhD Ministry of Environment, Uruguay

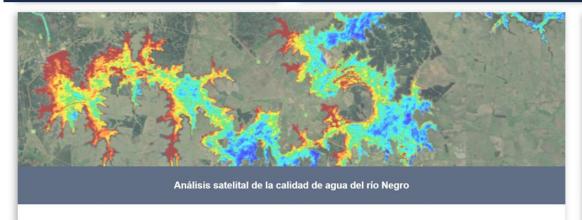

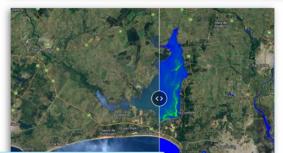

Residuos -Costero-Marino Participación -Evaluación de Impacto Ambiental -Indicadores Datos -Geoportal -**Documentos** 

La información de los parámetros de calidad de agua, obtenida del ajuste y procesamiento de las imágenes satelitales, es presentada en dos aplicaciones que muestran la concentración de Clorofila-a, Turbidez y CDOM (materia orgánica). Por un lado se presenta el dato satelital con alta definición (cuadrícula de 10 metros) más reciente y, en otra aplicación, la información actual e histórica (desde el 2016) procesada para 7 sectores de los embalses del Río Negro.

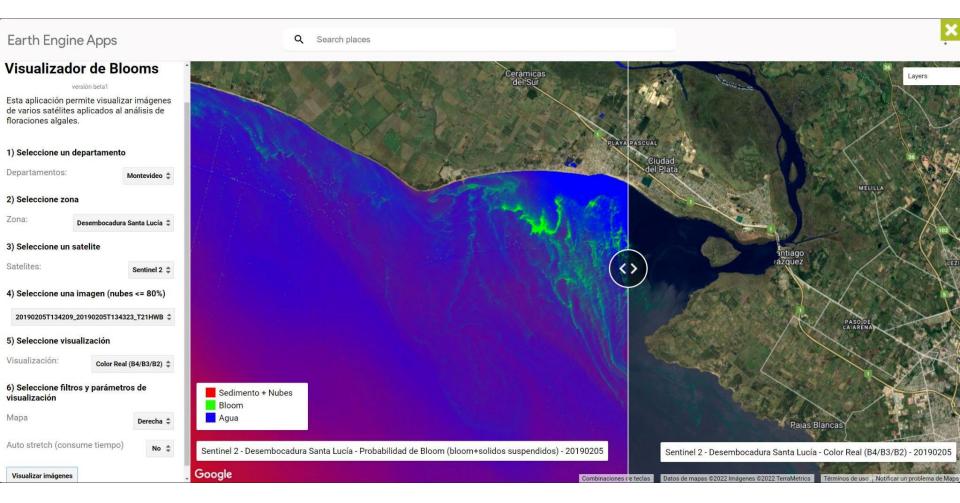

El Ministerio de Ambiente pone a disposición datos propios y de otras instituciones para su reutilización y combinación con otros conjuntos de datos.

**Satellite water quality data** - This application allows visualization of the satellite estimation of chlorophyll-a concentration, turbidity, and colored dissolved organic matter (cdom), from a process of calibration, validation, and processing of Sentinel 2 satellite images.

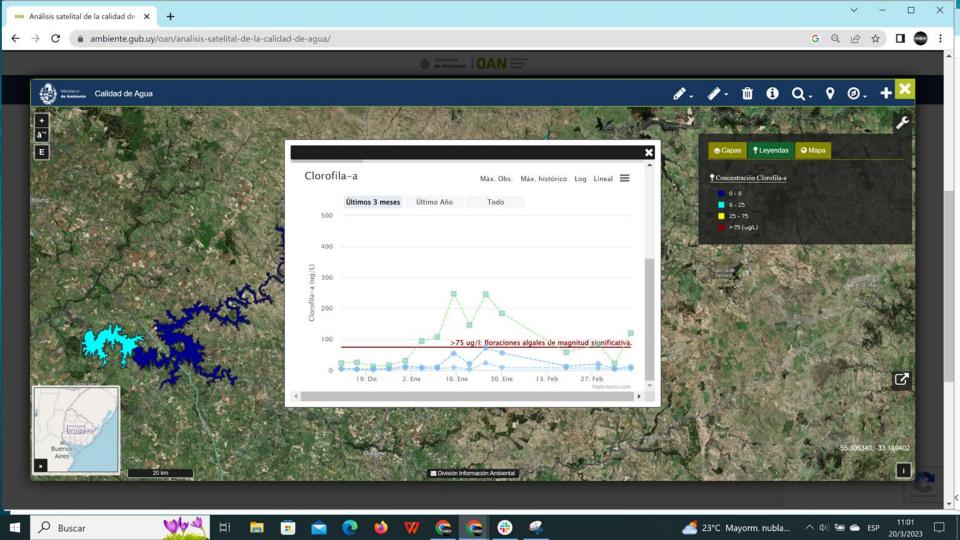

Month	January	February	March	May	June	September	October	November	Total
monitoring events	24	58	11	17	16	23	11	24	184

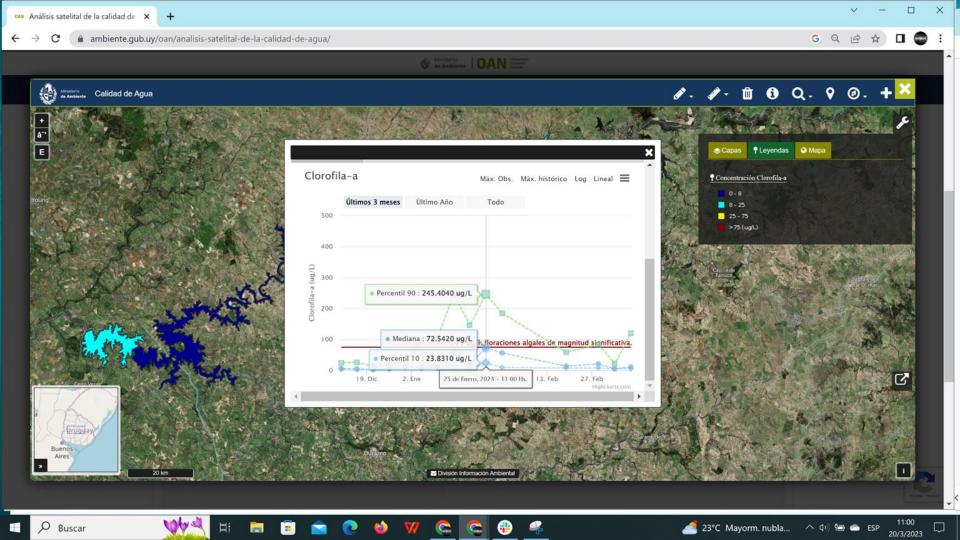

Zones of the Río Negro in which the calculations are made to generate the representative statistics of each of them. These correspond to a summary of 60 studied subzones.

**Satellite estimation of chlorophyll-a concentration and turbidity and cdom levels** -The daily value of the 10th, 50th and 90th percentiles of these parameters is observed for seven areas of the Negro River in its 3 reservoirs. The estimation was made based on the processing of Sentinel 2 satellite images from a calibration and validation process carried out specifically for this stream.

Graphs corresponding to a historical series of chlorophyll-a data from Sentinel 2 images. The series shows the marked difference between the high concentrations in summer-autumn and the different concentrations in the years.

## Campañas de validación de datos satelitales en el Río de la Plata

Ministerio de Ambiente (MA) y Universidad de la República (UdelaR) desarrollaron dos campañas de monitoreo en aguas interiores del Río de la Plata, con apoyo del Programa de Naciones Unidas para...

## 12/26/2022

The Ministry of the Environment (MA) and the University of the Republic (UdelaR) developed two monitoring campaigns in inland waters of the Río de la Plata, with the support of the United Nations Environment Program (UNEP), with the aim of obtaining data for compare water quality values measured with traditional methods Thank You! and values obtained through satellite images.
