

Components, sub-components and statistical topics of the FDES 2013

Component 3: Residuals

Introduction

- The FDES covers the main groups of residuals that are emissions of substances to air, water or soil, wastewater and waste, and the release of residuals from the application of chemical substances.
- Generally, emissions are analysed by the type of receiving environment (air, water or soil) and type of substance.
- Statistics on residuals must be broken down according to the economic activity that generated them, based on ISIC.

Scope and content

 Contains statistics on the amount and characteristics of residuals generated by human production and consumption processes, their management, and their final release to the environment.

Residuals:

- are flows of solid, liquid and gaseous materials, and energy, that are discarded, discharged or emitted by establishments and households through processes of production, consumption or accumulation.
- may be discarded, discharged or emitted directly to the environment or be captured, collected, treated, recycled or reused.

Overview

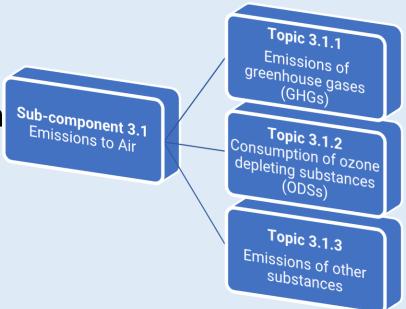

Component 3 Residuals	Sub-Component 3.1 Emissions to Air (3 topics, 20 statistics)	Topic 3.1.1: Emissions of greenhouse gases Topic 3.1.2: Consumption of ozone depleting substances Topic 3.1.3: Emissions of other substances
	Sub-Component 3.2 Generation and Management of Wastewater (3 topics, 11 statistics)	Topic 3.2.1: Generation and pollutant content of wastewater Topic 3.2.2: Collection and treatment of wastewater Topic 3.2.3: Discharge of wastewater to the environment
	Sub-Component 3.3 Generation and Management of Waste (2 topics, 20 statistics)	Topic 3.3.1: Generation of waste Topic 3.3.2: Management of waste
	Sub-Component 3.4 Release of Chemical Substances (1 topic, 7 statistics)	Topic 3.4.1: Release of chemical substances

Sub-Component 3.1: Emissions to Air

 The FDES focuses on the emission of pollutants from anthropogenic factors that are socio-economic processes.
 The statistical description of such emissions covers their sources and the quantities emitted by substances.

 The groups of different chemicals relevant to statistics on emissions to air include: Sulphur compounds; oxidized nitrogen compounds and oxidants; reduced nitrogen compounds; inorganic carbon compounds; halogen and inorganic halogen compounds; volatile organic compounds; heavy metals; and different fractions of particulate matter (PM).

Sub-Component 3.1: Emissions to Air

Topic 3.1.1: Emissions of greenhouse gases (GHGs)

- GHG emission inventories are compiled based on the guidelines developed by the IPCC, under the auspices of the United Nations Framework Convention on Climate Change (UNFCCC).
- The source categories of GHG emissions are based on processes.
- The most important direct GHGs are carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O).
- The most important indirect GHGs are sulphur dioxide (SO2), nitrogen oxides (NOx) and non-methane volatile organic compounds (NM-VOCs).
- While the IPCC guidelines prescribe process-based source categories, sources
 must be broken down by economic activity based on ISIC, to ensure consistency
 with and linkages to economic statistics.

Sub-Component 3.1: Emissions to Air

Topic 3.1.2: Consumption of ozone depleting substances (ODSs)

- ODS is another important category of emissions that is actively monitored by the Montreal Protocol.
- Reported statistics worldwide have shown this protocol to be very effective in phasing out the use of these substances.
- Examples of ODS include chlorofluorocarbons (CFCs), hydrochlorofluorocarbons (HCFCs), halons, methyl chloroform, carbon tetrachloride and methyl bromide.
- However, as emissions of these substances are difficult to measure directly, countries report on the apparent consumption [production +imports-exports] of ODS.

Sub-Component 3.1: Emissions to Air

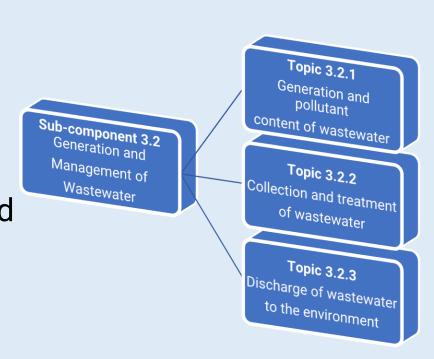

Topic 3.1.3: Emissions of other substances

- Other environmentally important polluting substances are emitted to air beyond GHGs and ODS. The most important ones are:
 - o different fractions of particulate matter (PM2.5, PM10).
 - heavy metals and other substances linked to environmental and health problems.
- Countries may wish to measure or estimate a variety of other emissions, based on national circumstances and priorities.

Sub-Component 3.2: Generation and Management of Wastewater

- The FDES focuses on the emission of pollutants from anthropogenic factors that are socio-economic processes. The statistical description of such emissions covers their sources and the quantities emitted by substances.
- The groups of different chemicals relevant to statistics on emissions to air include: sulphur compounds; oxidized nitrogen compounds and oxidants; reduced nitrogen compounds; inorganic carbon compounds; halogen and inorganic halogen compounds; volatile organic compounds; heavy metals; and different fractions of particulate matter (PM).

Topic 3.2.1: Generation and pollutant content of wastewater

- Includes statistics on the volume of water that is no longer required and is thus
 discarded by the user and statistics on the amount of pollutants contained in
 wastewater (emissions to water) before any collection or treatment.
- Statistics on the generation of wastewater and emissions to water should be broken down by the economic activity and households that generate them.
- Wastewater generation is usually estimated based on the volume of water used.
- The pollutant content of wastewater (emissions to water) can usually be obtained from monitoring at the place of generation or from estimates based on technological parameters.

Topic 3.2.2: Collection and treatment of wastewater

- Wastewater may be discharged directly to the environment by the generator or collected in sewerage systems and treated in wastewater treatment plants.
- Include statistics describing:
 - volumes of wastewater collected and transported to its final place of discharge or treatment facilities;
 - II. volume of wastewater treated by type of treatment (primary, secondary and tertiary);
 - III. physical infrastructure related to wastewater collection and treatment (e.g., number of treatment plants, capacities of plants);
 - IV. pollutant content extracted in the treatment facilities; and
 - V. other relevant information.
- Establishments that collect and treat wastewater are grouped under ISIC Rev.4,
 Section E, Division 37 Sewerage.

Topic 3.2.3: Discharge of wastewater to the environment

- This topic captures information at the stage of final discharge of wastewater to the environment. It includes volume of wastewater discharged to the environment:
 - I. without treatment
 - II. after treatment, by type of treatment (primary, secondary and tertiary) and type of treatment facility (public, private, municipal, industrial), and
 - III. effluent quality.
- Sources of data are the Statistics on the volume of wastewater:
 - discharged after treatment can be obtained from administrative records of the treatment plants.
 - released without treatment can be obtained from economic units and records of sewerage companies or estimated on the basis of water use. The volume of discharged wastewater should also be disaggregated by recipient water body.

Topic 3.2.3: Discharge of wastewater to the environment

Emissions of pollutants to water bodies:

- In addition to the volume of wastewater returned to the environment, it is also important to measure or estimate the volumes of different pollutants that are emitted with the wastewater or otherwise released to water bodies.
- Emissions to water are the substances released to water resources by establishments and households as a result of production, consumption and accumulation processes.
- Statistics on emissions to water should be disaggregated according to the releasing economic activities and should cover the most important substances.

Q & A

Sub-Component 3.3: Generation and Management of Waste

- Includes statistics on the amount and characteristics of waste, defined as discarded material for which the owner or user has no further use, generated by human activities in the course of production and consumption processes.
- Relevant statistics cover the amount of waste generated by different sources that are economic activities (by ISIC categories) and households.
- Policy makers, particularly local governments, require statistics on waste in order to assess how its generation changes over time.

Topic 3.3.1: Generation of waste

- This topic includes statistics describing the amount of waste generated before any collection or treatment, by waste type, and by generator (economic activity ISIC) and households).
- The waste lists that countries and international organizations use for waste statistics are usually based either on the generating process or the material content of the waste, or on the combination of the two.
- Statistics on waste generation are usually estimated from the records of the economic units engaged in waste collection, treatment and disposal.

Topic 3.3.1: Generation of waste

- Hazardous waste is a special group of waste that, due to its toxic or other hazardous character, requires special management and is controlled by law in many countries.
- The Basel Convention, a multilateral environmental agreement, focuses on the control of transboundary movements of hazardous waste and establishes criteria for the environmentally sound management of such waste.
- Reporting needs under this convention include the generation of hazardous waste, as well as the imports and exports of hazardous waste covered in Topic 3.3.2: Management of Waste.

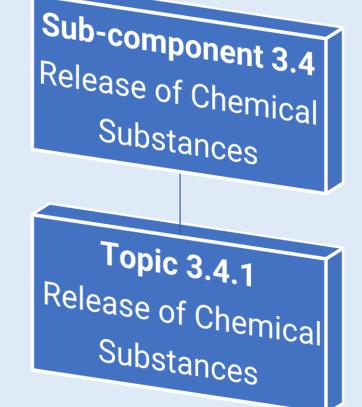

Topic 3.3.2: Management of waste

- Includes statistics on:
 - the amount of waste collected and transported to treatment facilities or final disposal;
 - II. the amount of waste treated and disposed of by type of treatment and disposal (e.g., reuse, recycling, composting, incineration, landfilling, other);
 - III. the physical infrastructure for waste treatment and disposal, including the number and capacity of treatment and disposal plants; and
 - IV. other relevant information.

Sub-Component 3.4: Release of Chemical Substances

- Release of chemical refer to a chemical that is emitted to the air, discharged to water, or disposed of in some type of land disposal unit
- This sub-component with cover chemical fertilizers and other chemicals

Sub-Component 3.4: Release of Chemical Substances

Topic 3.4.1: Release of Chemical Substances

- This topic deals with chemical fertilizers to enrich soils and pesticide use to
 protect plants and animals from disease. Other chemicals accelerate the growth
 of biota and preserve and enhance the quality, size and appearance of biological
 products.
- Environmental effects are generated by the diffusion of chemicals through cycling systems and build-up of contaminants in water, land and living organisms (through the food chain).
- Statistics include the amount of natural and chemical fertilizers, pesticides and other chemicals (hormones and pellets) used by type of active ingredients (see also Sub-component 2.5: Biological Resources), the area under application and the method employed. These statistics serve as a proxy or the basis for estimating the chemicals that remain in the environment and affect environmental quality.

Sub-Component 3.4: Release of Chemical Substances

Topic 3.4.1: Release of Chemical Substances

Multilateral Environmental Agreements (MEAs):

- The Stockholm Convention on Persistent Organic Pollutants (POPs) aims to eliminate or restrict the production and use of POPs. POPs are defined by the convention as "chemical substances that persist in the environment, bioaccumulate through the food web, and pose a risk of causing adverse effects to human health and the environment".
- The Stockholm Convention identified an initial 12 chemicals or chemical groups for priority action, including aldrin, chlordane, DDT, dieldrin, endrin, heptachlor, hexachlorobenzene, mirex, toxaphene, PCBs, polychlorinated dioxins and polychlorinated furans.

Primary institution (s) responsible for the following statistics

Sub-component 3.1: Emissions to Air						
Topic 3.1.1: Emissions of greenhouse gases						
Statistics	Institution (s)					
a.1. Carbon dioxide (CO2)						
a.2. Methane (CH4)						
a.3. Nitrous oxide (N2O)						
b.1. Sulphur dioxide (SO2)						
b.2. Nitrogen oxides (NOx)						
Sub-component 3.2: Generation and Management of Wastewater						
Topic 3.2.1: Generation and pollutant content of wastewater						
a. Volume of wastewater generated						

Primary institution (s) responsible for the following statistics

Topic 3.2.2: Collection and treatment of wastewater							
Statistics	Institution (s)						
a. Volume of wastewater collected							
b. Volume of wastewater treated							
Topic 3.2.3: Discharge of wastewater to the environment							
a.1. Total volume of wastewater discharged to the environment after treatment							
b.1. Total volume of wastewater discharged to the environment without treatment							
Sub-component 3.3: Generation and Management of Waste							
Topic 3.3.1: Generation of waste							
a. Amount of waste generated by source							
c. Amount of hazardous waste generated							

Primary institution (s) responsible for the following statistics

Topic 3.3.2: Management of waste							
Statistics	Institution (s)						
a.1. Total municipal waste collected							
a.2. Amount of municipal waste treated by type of treatment and disposal							
a.3. Number of municipal waste treatment and disposal facilities							
b.1 Total hazardous waste collected							
b.2. Amount of hazardous waste treated by type of treatment and disposal							
b.3. Number of hazardous waste treatment and disposal facilities							
d. Amount of recycled waste							

Thank you
